APPENDIX B:

Watercourse 5 & 6 Class Environmental Assessment Study Draft Report, Dillon Consulting, November 2007

Appendix D: Existing Condition – Fluvial Geomorphology Detailed Assessment

APPENDIX D
Existing Conditions
Fluvial Geomorphology Detailed Assessment

Fluvial Geomorphology – Existing Conditions

Introduction

Watercourses within the area of interest were observed in the field and characterized as to their geomorphic attributes. The watercourses were examined on a reach basis and characterized as being either “in regime”, in transition or in adjustment, hereafter referred to as stable or unstable. Further, typical channel indicators were used to confirm this classification and allowed for identification of the dominant geomorphic processes (widening, incising, planimetric adjustment, etc.). Identification of the nature and degree of geomorphic processes aids in the prediction of future behaviour of a particular reach. This is due principles of geomorphology which state that a watercourse will react, by adjusting its form (observable instability), to changes in flow or geometry. Typically, changes in flow may result from an alteration in watershed conditions, while changes in channel geometry may occur as a result of straightening.

Though the intricacies of channel adjustment are not easily predicted, the river continuum concept predicts that changes in channel form occur in an evolutionary manner, assuming conditions contributing to the instability remain relatively constant. This principle can account for past watercourse behaviour, and can aid in the prediction of future behaviour by identifying where a particular reach (or series of reaches) falls within this continuum.

Information derived from the geomorphic assessment will be incorporated into the development of drainage improvement alternatives. This information will provide insight to, ideally, which watercourses may be better equipped, from a geomorphological perspective, to handle anticipated changes in flow. A determination of stability (stable or unstable) has been made of each reach, as well as the nature of the reach’s “sensitivity to erosion”. Erosion sensitivity descriptors include “low”, “moderate” and “high”, and refer to the reaches’ likely tolerance for accommodating an increase in flow regime, without initiating significant or catastrophic sediment transport. A classification of “low” indicates that the reach would likely accommodate increased flow without initiating major erosion beyond that observed in the field.

Further to the empirical evidence for channel processes, a Rapid Geomorphic Assessment (RGA) Classification was completed for the four watercourse reaches having the most significant geomorphic form and function. A RGA employs a series of indicators (similar to those described above), and a presence/absence formula to derive an overall stability index (SI) value. The SI value provides additional evidence, supporting the initial classification of “stable” or “unstable”. Reaches with an aggregate SI of equal to or less than 0.2 are classified as in regime (dynamically stable). Reaches with SI score of 0.21 – 0.4 are transitional or stressed, and a score of greater than 0.4 is classified as “in adjustment”, or unstable.

The findings presented below periodically reference a geomorphic photo record, following the observations.

Observations

Watercourse 5.0

Downstream of QEW
This portion of Watercourse 5.0 can be classified as a highly altered reach; having little to no naturally defined morphology. The watercourse, shown in the photo record in planview (Plate 1), consists of a straightened low flow channel set within a concrete block lined valley. Some cattails persist, however there is no opportunity for natural development of a pattern or profile within this hardened setting. Some sand and gravel substrates were observed within the concrete block crevices. Plates 2 and 3 provide an overhead view of the valley. A connection should be noted (visible in Plate 1), entering from the east and transferring flow from Watercourse 6.0 to 5.0.

Downstream of North Service Road, Watercourse 5.0 empties into a backwater area, set between two culverts, having water levels governed by Lake Ontario. This pool flows through a multi-celled culvert and into a private marina. Due to its segregation by the culverts, this pooled area has little to no geomorphic significance from either a riverine or coastal perspective.

Generally, the reach of Watercourse 5.0 downstream (north) of the QEW can be classified as artificially stable, having a low sensitivity to erosion due to significant hardening of the watercourse and valley.

Between South Service Road (SSR) and QEW – Upstream of QEW
Watercourse 5.0 between south service road and the QEW takes on a significantly different form than the hardened reach downstream of the QEW. Here the channel remains altered, with the historic alteration likely consisting of straightening to accommodate adjacent development. The dominant characteristic through this portion of Watercourse 5.0 appears to be reach-wide channel widening. This instability is not uniform; but rather, is manifesting through varying geomorphological processes. Plate 4 provides an aerial perspective of this reach. A junk yard is visible immediately west of the watercourse and is likely the reason for historic straightening.

This reach of Watercourse 5.0, from SSR downstream for approximately 190m (extending to the end of the confining junkyard fence) is significantly unstable, dominated by active channel widening. Identification of a true bankfull level is made difficult by the altered nature of the reach, though high water marks indicate that the channel cross section is entrenched. Due to a combination of historic channelization and changes in flow regime, floodwaters are denied access to the floodplain, confined instead within the active channel. The resulting increased depth places additional erosive stress on the channel boundary and, as the boundary adjusts, erosion occurs. Bank widening, as indicated by basal scour, leaning vegetation, exposed roots, top-of-bank fractures, etc., is the dominant process, and typically precedes a natural development of a new thalweg meander. The channel attempts to self correct altered conditions, ultimately resulting in natural channel hydraulics and geometry similar to those found in unaltered reaches.

Bank angles along much of this reach are near-vertical, typical of channel widening and increasing the susceptibility to erosion. Woody riparian vegetation was found leaning, with roots exposed in many instances. Plates 5-8 provide representative images of the observed channel widening within this sub-reach.

Mid channel bars were observed throughout and are further indicators of reach, and possibly system wide, instability. Mid channel, poorly sorted bar features are typically found in unstable reaches and are a symptom of the system's inability to efficiently transport sediment. Instead of migrating through Watercourse 5.0, increased stream power is blasting bed and suspended loads throughout, depositing material haphazardly as flood waters recede.

Some pools were noted, located between mini cascades caused by fallen vegetation and collected debris. These pools were free of fines, again an indicator or instability. Hard clay was exposed in some pool; its presence likely accelerating the local bank widening process. In locations where the most significant widening has already occurred, the thalweg continues to form its new planform, with cut-off channels and multiple threads observed.

Downstream of the junkyard fence the channel form changes. Here, the degree of entrenchment is less severe and better developed geomorphic features exist. For a distance of approximately 50m banks are more stable and some pools contain finer grains. Some point bar features were noted. Plate 9 depicts a typical section of channel through this sub-reach. Instability in the form of channel widening persists, but at a reduced rate as compared to immediately upstream (adjacent to the junkyard).

As Watercourse 5.0 approached the QEW culvert a large nick point (Plate 11) cuts into the underlying clay. This nick point, located approximately 30m upstream of the QEW culvert, is approximately 1.0 in height and can be considered a major geomorphic feature and indicator of instability. Nick points are upstream migrating, channel degradation features that are manifestations of the channel's self adjustment, usually (in urban settings), in response to changes in flow or geometry. The adjustment will ultimately result in a new channel gradient; one more hydraulically accommodating to the new flow regime. Plate 12 provides a view of the short reach between the nick point and the QEW culvert.

The finding of such a large incision point is somewhat out of synch with the observed upstream widening processes, as channel downcutting typically precedes widening as a reach wide evolutionary process. This finding indicates that the entrenched portion of channel adjacent to the junkyard likely acts independently with respect to active geomorphic processes. Regardless of the reach breakdown, the evidence strongly suggests major, overlapping instabilities along the subject reach of Watercourse 5.0. Consequently, this reach of Watercourse 5.0 can be classified as unstable, and likely carries with it a high sensitivity to erosion. A Rapid Geomorphic Assessment (RGA) was completed for this reach, producing a score of 0.65, indicating an unstable system in deep geomorphic transition.

Upstream of South Service Road

Upstream of SSR Watercourse 5.0 continues in its highly altered form, with straightening even more pronounced as the channel (looking upstream from SSR) follows the west boundary of an industrial property, then turns to follow the CN tracks, and again along the western margin of more industrial lands. Plate 13 provides an aerial view of Watercourse 5.0 between SSR and

Arvin Avenue. Within these straightened reaches, channel instabilities persist, with channel widening (Plates 14-16) acting as the dominant process.

The watercourse is significantly entrenched along this entire reach, with entrenchment being even more pronounced upstream of the CN tracks where the channel lies within a deeply incised ravine-type feature (Plate 17-18). Riparian vegetation is consistently exposed at the roots and many medium to larger trees are leaning or have fallen. In some instances, major bank failures were observed where fallen vegetation had collected sediment and debris, deflecting major storm flows at the adjacent banks.

Anecdotal evidence, provided by maintenance workers at the adjacent industrial property, indicates that this watercourse recently flowed up to 5 feet in depth, described as the deepest depth ever seen by area workers. Even at this depth, the flood waters are constrained within the active channel, allowing for no flood relief within the floodplain. Shear stress, under even moderate flood events, given the steep channel banks and lack of cross section relief would likely result in significant erosion as evident by the scoured banks along the length of this reach.

Upstream of the approximately 75m of channel and ravine which parallels the CN tracks, Watercourse 5.0 is situated adjacent to another industrial yard. Here the banks are frequently hardened, upstream to (and beyond) the Arvin Ave. crossing (Plate 19). Primarily a conveyance channel, the watercourse along this reach exhibits little defined morphology. Channel widening persists and a continued lack of fines indicates that these heavily urbanized, channelized reaches are subject to flashy, erosive flows.

Upstream of the Arvin Ave. crossing, channel alteration, in the form of bank hardening (Plates 20-21) and a confined channel, continues to result in bank undermining and unstable conditions. The observable effects, however, such as the severity predicted rate of erosion, lessen as the reach nears its upstream, undeveloped headwaters. Reduced watershed stressors, and lessened stream power (due to reduced drainage area in these upper reaches) result in an overall reduction in the degree of erosion. Though attenuated, the dominant process remains channel widening, as evident by basal scour, fallen vegetation, and top of bank fracture lines.

Upstream of Barton Street, Watercourse 5.0 exhibits a more natural form, though access was largely restricted due to property issues. Here, as seen on the left side of Plate 22, the channel appears to have ready access to its floodplain. Consequently, entrenchment appears reduced. Instances of leaning vegetation and severe bank instability are reduced.

Generally, upstream of South Service Road, Watercourse 5.0 can be considered unstable, with entrenched conditions and active widening dominating the geomorphic processes. Stream power diminishes further upstream and the effects of urbanization are lessened, resulting in less frequent instances of major bank and bed instability. Minor bank erosion persists throughout the entire subject area. The overall sensitivity to erosion has been classified as high (between SSR and the CN track) and moderate (upstream of the CN tracks) respectively. A stability index scored was calculated to be 0.40 for this reach, indicating and unstable channel on the cusp of transition and active adjustment.

Upstream of Barton Street, conditions appear much more stable. Aerial photography indicates that intense urbanization of the watershed ceases at this point.

Watercourse 6.0

Downstream of NSR to Lake Ontario
Watercourse 6.0 is an altered watercourse, previously straightened, located within a woodlot area set between an residential development (to the west) and a development under construction (to the east). Plate 23 provides an aerial view of Watercourse 6.0 downstream of the QEW.

The reach downstream of QEW represents a low energy system due to the shallow channel gradient. The system is unstable; however the dominant erosion process (channel widening) is retarded due to the lack of energy. With the exception of a few localized instances, the reach of Watercourse 6.0 between NSR and the new crossing (not yet complete) of Lakeshore Drive, is uniform in its geomorphic characteristics. Plates 24-30 illustrate this portion of channel.

As seen in Plate 24-30 channel banks are typically well vegetated and are relatively stable, sitting at bank angles between 1.5:1 and 2.1. Some leaning vegetation is evident, however the degree of lean and amount of exposed root is significantly less than that observed in other, more actively eroding reaches. Verification of presence/absence of basal scour was not entirely possible due to ice and snow cover.

Several pools and long glides exist, mostly separated by small debris jams that create mini cascades. Pools appear to retain a healthy quantity of fine grained material, suggestive of the low energy nature of flood discharge passing through this reach.

There is little to no sinuosity along this reach of Watercourse 6.0. Channel top widths range between 5-8m wide. The active channel, as defined by water marks, measured approximately 3m wide and 1m deep. Identification of naturally formed bankfull indicators is made difficult by the altered nature of the reach. The channel cross section can be described as a moderately entrenched. While there appears to be no evidence of flood flows gaining access to the adjacent floodplain, the wider cross section and shallow bank angles result in a reduction of depth of flow under flood conditions. This factor, combined with the low energy component, likely results in reduced bed and bank shear stress.

Erosive forces are, however, sufficient enough to cause significant bank erosion at localized channel constrictions, as seen in Plate 26. Here, fallen vegetation has resulted in a deflection of flows and severe bank erosion. This occurrence, however; is not symptomatic of Watercourse 6.0 downstream of QEW.

Downstream of a new (currently under construction) crossing of Lakeshore Drive, shown as a dashed yellow line on Plate 23; Watercourse 6.0 takes on a more entrenched cross section. Here (Plate 31-32), basal scour and other channel widening process dominate. This condition extends downstream to the enclosure of Watercourse 6.0 at Cope’s Lane.

Generally, the reach of Watercourse 6.0 downstream of QEW can be classified as unstable. Approximately 350m of channel (upstream of the new Lakeshore Drive crossing) may be considered moderately sensitive to erosion, lacking the specific energy necessary to cause accelerated bank erosion. A RGA was completed for this reach, producing a score of 0.24, indicating a system on the cusp of stable but still in transition or stressed. The reach downstream of the Lakeshore Drive crossing is considered unstable and highly sensitive to erosion, due, in part, to it's constricted cross section and exposed banks.

Between QEW and South Service Road (Plate 34)
Watercourse 6.0 between QEW, upstream to SSR, consists of a loosely defined, hummocky channel, set within a shallow valley feature. Channel banks have slumped in many locations, but exhibit not signs of mass failure (cracking) or scour. This reach is a low energy environment, not suffering from an entrenched cross section. The reach can be classified as unstable, due primarily to the frequently slumping banks; however, channel widening is not the active process.

The channel form within this reach is more indicative of retarded planimetric adjustment. The channel thalweg varies between well-defined and undefined, and alternates between a single and multi-threaded channel. The slumping banks are likely the remnants of historical, more active erosion. At present, the low flow channel is establishing its alignment, rearranging and reforming the low profile, hummocky banks. This reach of Watercourse 6.0 can be considered unstable and of moderate sensitivity to erosion.

Upstream of South Service Road (Plate 35)
Property access was hindered at this reach, but observations made from South Service Road indicate that this reach is suffering from instability in the form of channel widening. Heavily eroding banks are visible in the vicinity of SSR, and tall riparian vegetation can be seen leaning for some distance from the road. A specific determination of overall stability was not rendered due to the lack of property access.

Upstream and Downstream of Barton Street
Watercourse 6.0 in the vicinity of Barton Street is a highly altered, unstable reach where channel widening in the form of bank erosion dominates the geomorphic regime. Indicators of channel widening are evident in Plates 36-38. Streambank vegetation is exposed at the roots and leaning heavily. Bank undermining was observed throughout the reach. The longitudinal morphology of this reach consists of long pools, separated by fallen or accumulated debris. Few fines were observed in the pools. Channel entrenchment does not appear to be a major contributor to erosion within this reach; rather, urbanized flows and historical channel straightening are likely the root causes of the observe instability. This reach, immediately downstream of Barton Street, can be classified as unstable, having a moderate sensitivity to erosion.

Upstream of Barton Street (Plate 39) Watercourse 6.0 is incised, with some bank hardening evident. Property access was restricted to the reach immediately upstream of the Barton Street culvert. Here the channel exhibits same instabilities, as seen downstream, with widening being the dominant process.

<u>Watercourse 6.1</u>

Downstream of QEW (Plate 43)
Watercourse 6.1 downstream of the NSR culvert has been realigned in a natural valley configuration. This work was recently completed, in that the erosion control blanket has obviously recently been laid. As such, the reach was not examined for geomorphic conditions.

Upstream of QEW
Watercourse 6.1 at South Service Road (Plate 44) consisted of primarily cattail lined ditch drainage. No morphological features were detected. Channel banks are grassed and low in profile. Property access was restricted in the industrials lands between SSR and Barton Street. No instabilities were observed. Channel definition at Barton Street is further marginalized, with the grassed ditches here having little to no riparian vegetation. Some drainage was noted at the terminus of Arvin Ave. This reach also contained no channel of geomorphic significance, and can be better classified as a pooled backwater area. Watercourse 6.1 upstream of QEW can therefore generally be classified as stable and of low sensitivity to erosion.

<u>Watercourse 6.2 and 6.3</u>

Downstream of QEW
Watercourse 6.2 downstream of the QEW consists of a low energy system, a 125m portion of which is well vegetated with woody riparian species (Plate 46). Banks are relatively low in profile and appear stable. Finer, mucky substrates dominate this reach. Downstream of these wooded channel, Watercourse 6.2 flows into a rip rap, engineered channel (Plate 47); it's location shown on Plate 45 between the two yellow lines. Further downstream the watercourse flows through an open meadow, devoid of significant riparian vegetation, but similar in morphology to the wooded reach. Both portions of channel suffer from a lack of morphological features, dominated by stagnant water or long pools having muck bottoms. The entire reach can be classified as stable and of low sensitivity to erosion, due primarily to the lack of available erosive energy (stream power) and the controlling rip rap channel. A RGA was completed for this reach, producing a score of 0.12, indicating a stable reach.

Watercourse 6.3 downstream of the QEW flows for only a short distance of open channel, before entering a small stormwater management facility. This channel can be characterized as cattail lined, ditch drainage having no morphological significance. The watercourse is enclosed downstream of this SWM pond to its outlet to Lake Ontario.

Upstream of QEW
Watercourse 6.2 upstream of the QEW flows only as grassed ditch drainage, following the alignment of Constellation Drive.

Watercourse 6.3 was not located upstream of the QEW.

Conclusions

The observed reaches appear to have commonalities, in that all are either partially or fully classified as geomorphically adjusting systems. These findings are typical of fluvial systems set within highly urbanized watersheds, in particular those lacking significant stormwater management, as is the case in this block of land.

The existing conditions findings will be employed as input into the decision matrix, aiding in the development and evaluation of storm water improvement alternatives.

The assessment was used in conjunction with historical rare bird species accounts from the NHIC and Ontario Breeding Bird Atlas data to determine which species are likely to occur in the Study Area that are listed under the federal *Species at Risk Act*, provincial *Endangered Species Act*, or that may otherwise be of management concern.

Wildlife species including mammals, lepidopterans and odonata, were recorded through incidental observations during all phases of field work in the Study Area and are reported herein.

2.6 Fisheries Survey

Fisheries field work was conducted on May 25, 2009. Due to site access issues and the overall length of Watercourse #5, three (3) representative reaches were selected and investigated in detail. They are known herein as the "Downstream Section", "Middlestream Section", and "Upstream Section." For these sections, watercourse field record forms and habitat map forms were used to record detailed information, and photographs were taken to show existing conditions. General notes and photographs were taken at key points along Watercourse #6 and #7 to document their features and functions within the Study Area.

Fish community surveys were conducted in the Watercourse #5 system, where conditions permitted, using a Model HT 2000B backpack electrofishing unit.

The results of the review of background information and field investigations were compared and used to summarize existing fish habitat conditions and to confirm the status of the fishery in each system (i.e., direct, indirect, or not fish habitat). In addition, this information was used to identify constraints to development, potential impacts from surrounding development, and appropriate mitigation measures necessary to protect the watercourses.

2.7 Species at Risk

Several sources, including: the NHIC database; the Atlas of Mammals of Ontario (Dobbyn, 1994); the Ontario Herpetofaunal Atlas (Oldham and Weller, 2000); the Ontario Breeding Bird Atlas (2001-2005); the federal *Species at Risk Act* (SARA) Public Registry (http://www.sararegistry.gc.ca/default_e.cfm); and the provincial species at risk (SAR) list (http://www.mnr.gov.on.ca/MNR/speciesatrisk/status.html) formed the basis to establish the possible presence of species at risk in or immediately adjacent to the Study Area. Consultation with the Hamilton Conservation Authority also occurred. The MNR was contacted for this study but no response was received at the time of writing this report.

3. RESULTS

3.1 Natural Heritage Features and Designations

Through consultation with Hamilton Conservation Authority and a search of the NHIC database, no designated Natural Areas (i.e. ANSI, ESA, Conservation Areas, etc.) were found within or directly adjacent to the Study Area. According to the Hamilton Conservation Authority, they do not have species or habitat information for the Study Area.

Review of the City of Hamilton Watercourse 5 & 6 Class Environmental Assessment Study Draft Report (Dillon 2007) found correspondence records outlining aquatic and terrestrial features within the Study Area. It is noted that, DFO and OMNR have identified Watercourses #5, 6 and 6.1 as fish habitat. However, the Hamilton Conservation Authority also states that due to perched culverts at the watercourse outlets to Lake Ontario, it is unlikely that they directly support a fish population, but they contribute as indirect fish habitat. In addition, communication with MNR for the aforementioned study revealed that no fisheries information exists for these particular watercourses (#5, 6 and 6.1).

Dillon (2007) confirmed with the MNR that *no provincially significant wildlife usage, woodlots, wetlands, or species at risk currently exist within the* watercourse #5 & #6 Study Area which overlaps partially with the current Study Area. Further information specifically relating to these watercourses and their associated aquatic habitat can be found in Section 3.6 of this report.

Review of the Urban Hamilton Official Plan found that the Study Area is included entirely within the urban boundary. Schedule B – Natural Heritage System of the Urban Official Plan identifies *Core Areas*. Core Areas include key natural heritage features and key hydrologic features of the Greenbelt Plan as well as other locally and provincially significant natural areas that have been identified within and outside the Greenbelt Plan

Area. Local natural areas to be included as core areas are specifically identified by Schedules B1-8 - Detailed Natural Heritage Features. See **Appendix A** for all Urban Hamilton Official Plan Schedules referred to in this report.

Two *Core Areas* are located along Watercourse #6 and four *Linkage* areas are scattered within the eastern block of the Study Area (see **Figure 3.1**). The two *Core Areas* are further defined on Schedules B-2 and B-4, comprised of two significant woodlands and one wetland. Additionally, Schedules B2 and B4 show a little woodland and two smaller wetlands located along Watercourse #7. Schedules B-5 and B-8 identify *Key Littoral Zones* and *Key Stream Features*, respectively. Within the Study Area, there are three small *Littoral Zone Features* within the western block and Watercourses #5, 6 and 7 are designated as *Key Stream Features* (see **Figure 3.1**).

A portion of the Study Area is also included in the Greenbelt Plan area. The property known as Concession 2, Lot 11 is designated as *Protected Countryside* under the Greenbelt Plan (see **Figure 3.1**). The Greenbelt designated area within this property is bounded by Barton Street to the north, Glover Road to the east, Highway 8 to the south and Concession 2, Lot 13 to the west. Section 4.0 of the Greenbelt Plan (MMAH 2005) outlines the general policies relating land uses for *Protected Countryside* areas.

Immediately adjacent to the Study Area, south of Highway 8, the Niagara Escarpment Planning Area occurs (see **Figure 3.1**). This section of the Niagara Escarpment Planning Area is designated as Protection Area (Schedule A – Rural Hamilton Official Plan). Land use for this area is designated as Specialty Crop (Schedule D – Rural Hamilton Official Plan).

3.2 Ecological Land Classification

The Study Area is comprised of a mixture of natural and cultural vegetation communities, ranging from deciduous forest/swamps to agricultural fields. With information gathered during field studies, vegetation communities were mapped on aerial photography according to ELC nomenclature to graphically represent the specific spatial pattern in the vegetation cover according to species composition, physiognomy, and physical site characteristics (see **Figure 3.2**).

Eleven distinct ELC communities within the Study Area limits were identified to the vegetation level. These include:

- Fresh-Moist Green Ash Hardwood-Lowland Deciduous Forest (FODM7-2);
- Fresh-Moist Shagbark Hickory Deciduous Forest (FODM9-4);
- Fresh-Moist Oak – Hardwood Deciduous Forest (FODM9-6);
- Fresh-Moist Mixed Meadow (MEMM4);
- Bulrush Gaminoid Mineral Meadow Marsh (MAMM1-15);
- Purple Loosestrife Forb Mineral Meadow Marsh (MAMM2-5);
- Reed Canary Grass Graminoid Mineral Meadow Marsh (MAMM1-3);
- Green Ash Mineral Deciduous Swamp (SWDM2-2);
- Willow Mineral Deciduous Swamp (SWDM4-1);
- Hawthorn (Dogwood/Buckthorn) Deciduous Shrub Thicket (THDM2-11);
- Native Deciduous Regeneration Thicket (THDM4-1);

Areas classified to the ELC community level documented in the Study Area include:

- Deciduous Woodlot (DECW)
- Forb Meadow (MEF);

Cultural areas documented in the Study Area include:

- Annual Row Crop (OAGM1);
- Vineyard (SAGM1);
- Orchard (SAGM2);
- Coniferous Plantation (TAGM1);
- Deciduous Plantation (TAGM3); and
- Hedgerow (H).

According to the NHIC, vegetation units surveyed in the Study Area are considered Secure in the province of Ontario (S5). For a couple of naturally occurring vegetation classifications, no provincial status was available. From our experience, these un-rated vegetation units are common in Ontario. See **Table 1** for detailed descriptions of each ELC community documented within the Study Area.

It should be noted that two tree plantation areas (2.50 ha and 1.08 ha) have been harvested in the recent past (See **Figure 3.2**). These plantation areas appear to have been removed within the last year as the land is denude of successional vegetation. Also, one 1.44 ha forested area in the floodplain of Watercourse #6 that had been harvested approximately five to ten years ago and has regenerated into a native deciduous thicket community.

Table 1 – Description of ELC Communities

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
DECW	Deciduous woodlot	-	This small woodlot consists of common buckthorn, red ash, domestic apple, Norway maple, hawthorn and gray dogwood.	This community is present alongside the hawthorn deciduous thicket and orchard in the eastern portion of the Study Area.
FODM7-2	Fresh-Moist Green Ash Hardwood-Lowland Deciduous Forest	Silty Clay; 3-4 moisture regime **Photo 20** in **Appendix C** (typical soil profile)	This mid-aged community's canopy and sub-canopy is dominated by red ash with rare occurrences of shagbark hickory, red oak and maple. Understory consists of bur oak, buckthorn and red ash. Jack'n pulpit, garlic mustard, enchanter's nightshade and spotted jewelweed are all present in groundcover.	This community is located along parts of the riparian corridor of Watercourse #6.
FODM9-4	Fresh-Moist Shagbark Hickory Deciduous Forest	Clay; 6 moisture regime	This mature community evenly contains shagbark hickory, bur oak and red oak. The understory contains red ash, red oak and white elm. Ground cover included Spotted Crane's Bill, jack'n pulpit, and Virginia creeper.	This community is located within the rural properties and vineyards in the northeastern portion of the Study Area.
FODM9-6	Fresh-Moist Oak – Hardwood Deciduous Forest	Silty clay loam; 5 moisture regime	The canopy of this naturally treed community's canopy is characterized by mature bur oak, white oak, red oak and shagbark hickory with a sub-canopy of red ask, trembling aspen and white elm. The understory is dominated by buckthorn with gray dogwood and pasture rose found occasionally.	This remnant mature forest community is a transition area between residential properties and agricultural fields in the northeastern section of the Study Area. A small green ash lowland forest (FODM7-2) was documented just east of

			The ground layer contains herbaceous species such as jack'n pulpit.	this community.
MEF	Forb Meadow	-	This forb meadow community consisted of common forb species such as wild carrot, red clover and goldenrods.	This community has a significantly lower percent composition of graminoid species than the mixed meadow community.
MEMM4 Inclusions: 1.MAMM1-15 2.MAMM2-5 & 3.MAMM1-3 **Photo 15** in **Appendix C**	Fresh-Moist Mixed Meadow Inclusions: 1. Bulrush Gaminoid Mineral Meadow Marsh 2. Purple loosestrife Forb Mineral Meadow Marsh & 3. Reed Canary Grass Graminoid Mineral Meadow Marsh	Clay; 6 moisture regime	The sparse canopy in this young community contains crabapple. The dominant understory consists of hawthorn, gray dogwood and rose species, while the ground layer is characterized by blue grass, barn grass, red top grass, wild carrot, red clover and timothy. <u>Inclusion #1</u>. This small bulrush meadow marsh has a dominant presence of hardstem bulrush. Other species present include purple loosestrife, barnyard grass, water plantain, curly dock, goldenrod and common cattail. <u>Inclusion #2</u>. Purple loosestrife dominates the area with common occurrences of common cattail. Other species include common reed, black bulrush, wild carrot, red osier dogwood. <u>Inclusion #3</u>. Monoculture of reed canary grass.	This large open community dominates large portions of the northwestern section of the Study Area. <u>Inclusion #1</u>. Evidence of standing water in the bulrush meadow marsh was present during September field work. <u>Inclusion #2</u>. This small purple loosestrife meadow marsh has a high presence of alien species No standing water was evident within the marsh in September. <u>Inclusion #3</u>. This meadow marsh vegetation community is a wet depression in the topography. .

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
OAGM1	Annual Row Crop	-	Cropland (e.g. soy, lettuce, etc.)	Active agricultural areas.
SAGM1 **Photo 16** in **Appendix C**	Vineyard	-	Vineland crop (e.g. grape)	Active agricultural areas.
SAGM2	Orchard	-	Orchard crop (e.g. apple, pear, etc.)	Active agricultural areas.
SWDM2-2 Inclusion: 1.SWDM4-1 **Photo 18** in **Appendix C**	Green Ash Mineral Deciduous Swamp Inclusion: 1. Willow Mineral Deciduous Swamp	Clay; 6 moisture regime	This natural wetland system's canopy is dominated by red ash with occasional presence of bur oak, white willow and Manitoba maple. The understory contains buckthorn, red ash and gray dogwood. The ground layer includes buckthorn, spotted jewelweed and common strawberry. 1. This is a willow swamp riparian community which occupies the banks of watercourse #6 and 7.	The green ash and willow mineral deciduous swamp vegetation types are the most common riparian vegetation communities in the Study Area.
TAGM1	Coniferous Plantation	-	This cultural area is located in the north-west portion of the site. Typical stands include Scotts pine, red pine, white pine, white spruce, etc.	Note: Plantation areas have been removed (labeled PR on the ELC figure). A small plantation area remains.
TAGM3	Deciduous Plantation	-	This cultural area is located in the north-west portion of the site. Typical stands include maple and oak species.	Note: Plantation areas have been removed (labeled PR on the ELC figure). A small plantation area remains.
THDM2-11	Hawthorn	Silty clay loam; 1 moisture	This young thicket consists of an	Extensive gaps were found

3.3 Botanical Survey

In total, 194 flora species were identified within the Study Area during the spring and early summer of 2009. A full list of plant species encountered during field surveys, including the status of individual species, is presented in **Table B.1** in **Appendix B.** Of these, 80 (41.2%) are listed as exotic or non-native species. No plants observed are listed species under the federal *Species at Risk Act* or the provincial *Endangered Species Act*. A total of 17 (8.8%) of the species encountered have a coefficient of conservatism of 6 or greater. To put that into context, the coefficients of conservatism (CC) ranges from 0 to 10 and represents an estimated probability that a plant is likely to occur in a landscape relatively unaltered from what is believed to be a pre-settlement condition. For example, a CC of 0 is given to plants such as Manitoba maple (*Acer negundo*), which have demonstrated little fidelity to undisturbed sites (i.e. may be found almost anywhere). Similarly, a CC of 10 is applied to plants like shrubby cinquefoil that are almost always restricted to a pre-settlement remnant (i.e. a high quality natural area). Introduced plants were not part of the pre-settlement flora, so no CC value is applied to these. The 17 species with a coefficient of conservatism of 6 or greater found within the Study Area include:

- Arrow-leaved aster (*Aster urophyllus*);
- Water arum (*Calla palustris*);
- Blue beech (*Carpinus caroliniana*);
- Shagbark hickory (*Carya ovata*);
- Blue bead lily (*Clintonia borealis*);
- Northern willow-herb (*Epilobium ciliatum ssp. glandulosum*);
- American beech (*Fagus grandifolia*);
- Spotted crane’s-bill (*Geranium maculatum*);
- Small forget-me-not (*Myosotis laxa*);
- Virginia creeper (*Parthenocissus quinquefolia*);
- White spruce (*Picea glauca*);
- White lettuce (*Prenanthes alba*);
- White oak (*Quercus alba*);
- Red oak (*Quercus rubra*);
- Pasture rose (*Rosa carolina*);
- Hardstem bulrush (*Scirpus acutus*); and

- Rose twisted stalk (*Streptopus roseus*).

3.4 Amphibians

Amphibians were monitored at five sites during the first of three surveys (April 17, 2009) conducted during the spring of 2009 (see Amphibian Monitoring Stations 1 to 5 on **Figure 2.1**). After the Study Area was expanded, seven more monitoring stations were added to accommodate the larger Study Area, resulting in twelve stations in total that were monitored for the final two survey dates on May 13 and June 9, 2009.

Survey point counts were located along public roads adjacent to areas where potential habitat could or did exist, as access to the interior portions of Study Area had not yet been attained.

Field work documented two amphibian species during the breeding season, which include the western chorus frog (*Psudacris triseriata*) and the tetraploid gray treefrog (*Hyla versicolor*). **Table 2** shows dates observed, calling codes and numbers of individuals observed, where possible. Two additional species were recorded through incidental observations during other field studies including Northern leopard frog (*Rana pipiens*) and green frog (*Rana clamitans*). All amphibian species observed are considered common to very common in the Province of Ontario and not evaluated as at risk by COSEWIC or COSSARO. Locally, all species are considered as either C*ommon* or A*bundant* according to the Hamilton Natural Areas Inventory (Dwyer, 2003).

During field work, salamanders were actively searched for in areas where appropriate habitat existed; none were found. Appropriate habitat is considered to be deciduous forests with moist, loose soils, under logs/deadfall or in leaf litter and ephemeral pools. There are areas of deciduous forests within the Study Area, as described in the ELC; however, no ephemeral pools were observed during field studies when the study team had full access to the entire Study Area.

3.5 Wildlife Surveys

Avian Community

Breeding bird surveys identified 52 species, with 6 additional species observed during other phases of field work, for a total of 58 bird species observed in the Study Area. Data from the 2nd Ontario Breeding Bird Atlas (BBA) indicates that a total of 103 bird species were found as possible, probable or confirmed breeders in atlas square 17PH08, which encompasses the Study Area.

The BBA data indicates that a total of 5 species at risk were found with breeding evidence in square 17PH08 during the second atlas project including short-eared owl (*Asio flammeus*), common nighthawk (*Chordeiles minor*), chimney swift (*Chaetura pelagica*), redheaded woodpecker (*Melanerpes erythrocephalus*) and Canada warbler (*Wilsonia canadensis*). Two individuals of chimney swift (*Chaetura pelagica*), which is federally and provincially listed as Threatened, were observed during field work. These birds were observed foraging in the air over the John Knox Christian school grounds near the Highway 8-Jones Road intersection. Species at risk are discussed in detail in Section 3.7.

Conservation Priority Species

The Conservation Priority for Birds of Southern Ontario report (Couturier, 1999) aims to help planning authorities set priorities for conservation efforts by targeting bird species (and their associated habitats) that are significant within their region. Specifically, this report advocates the use of prioritized lists of birds as tools that planning authorities might use when developing Official Plans (e.g., identifying significant wildlife habitat, Environmentally Sensitive Areas, etc.) and when evaluating development proposals.

Three distinct approaches have been used in establishing conservation priorities at the municipal level including Jurisdictional Responsibility, Preservation Responsibility, and Area Sensitivity. Each species breeding within each southern Ontario municipality is assigned a score for each of the three components. A species is added to the municipal priority list if it scores highly on at least one of the three individual components. A composite score is derived by summing the three individual scores and is used to rank species by conservation priority for planning purposes at the local level.

The list is designed to identify a broad group of species that represent a priority for conservation, based on the three components that make up the approach. Thus, the list is not intended to identify only rare species or species under immediate threat or in need of population restoration. Further, the approach is not designed to identify species that are indicators of ecosystem health or integrity. While many such species will undoubtedly be on the list, municipalities and others will be left with the job of deciding how to apply this information (Couturier, 1999).

Based on Appendix G – Master Priority Table for Southern Ontario (Couturier, 1999) we have determined that a total of 23 conservation priority species from the former Hamilton-Wentworth Region (which encompasses the Study Area) were observed during field surveys, including:

- Common loon (*Gavia immer*);
- American woodcock (*Scolopax minor*);
- Sora (*Porzana carolina*)/Virginia Rail (*Rallus limicola*);
- American goldfinch (*Carduelis tristis*);
- Barn swallow (*Hirundo rustica*);
- Northern rough-winged swallow (*Stelgidopteryx serripennis*);
- Black-capped chickadee (*Poecile atricapillus*);
- Bobolink (*Dolichonyx oryzivorus*);
- Eastern meadowlark (*Sturnella magna*);
- Orchard Oriole (*Icterus spurious*);
- Eastern kingbird (*Tyrannus tyrannus*);
- Horned lark (*Eremophila alpestris*);
- Northern mockingbird (*Mimus polyglottos*);
- Field sparrow (*Spizella pusilla*);
- Savannah sparrow (*Passerculus sandwichensis*);
- Swamp sparrow (*Melospiza georgiana*);
- Clay-coloured sparrow (*Spizella pallida*);
- White-throated sparrow (*Zonotrichia albicollis*);
- Mourning warbler (*Oporornis philadelphia*);
- American redstart (*Setophaga ruticilla*);
- Ovenbird (*Seiurus aurocapilla*);

- Yellow-rumped warbler (*Dendroica coronata*); and
- Blue-grey gnatcatcher (*Polioptila caerulea*).

Area Sensitive Species

Area sensitivity is based on the concept that certain species of birds will require a larger amount of preferred habitat to consistently breed within a region. Conversely, species not considered as area sensitive can be found breeding throughout a region, regardless of the amount of a particular preferred habitat type (Couturier 1999). During breeding bird surveys, 12 species considered area sensitive open country birds were observed, including:

- Northern mockingbird (*Mimus polyglottos*);
- Barn swallow (*Hirundo rustica*);
- Northern rough-winged swallow (*Stelgidopteryx serripennis*);
- Clay-coloured sparrow (*Spizella pallida*);
- Savannah sparrow (*Passerculus sandwichensis*);
- Field sparrow (*Spizella pusilla*);
- American goldfinch (*Carduelis tristis*);
- Brown-headed cowbird (*Molothrus ater*);
- Eastern meadowlark (*Sturnella magna*);
- Bobolink (*Dolichonyx oryzivorus*);
- Eastern kingbird (*Tyrannus tyrannus*); and
- Horned lark (*Eremophila alpestris*).

Three area sensitive marsh species were observed during breeding surveys, including swamp sparrow, common loon (observed flying over the Study Area) and a small rail not identified to species (sora or Virginia rail, both of which are considered area sensitive).

One area sensitive forest species was observed during breeding surveys, including mourning warbler (*Oporornis philadelphia*).

A table of bird species observed during field work along with conservation status is presented in **Table B.2** in **Appendix B**.

Other Wildlife Observations

Mammals

Information from the Atlas of the Mammals of Ontario (Dobbyn 1994) indicates that 22 mammal species have been observed in the vicinity of the Study Area, all of which are considered secure in Ontario (see **Table B.3** in **Appendix B**). Of these, 6 species of mammals were observed during field work including: white–tailed deer (*Odocoileus virginianus*), raccoon (*Procyon lotor*), eastern cottontail (*Sylvilagus floridanus*), grey squirrel (*Sciurus carolinensis*), meadow vole (*Microtus pennsylvanicus*) and northern short-tailed shrew (*Blarina brevicauda*).

Herptiles

Ontario Herptofaunal Atlas information (Oldham and Weller 2000) indicates that 15 species of amphibian and 13 reptile species have been observed in the vicinity of the Study Area, including 7 species at risk: Jefferson salamander (*Ambystoma jeffersonianum*), common snapping turtle (Chelydra serpentina), Blanding's turtle (*Emydoidea blandingi*), wood turtle (*Clemmys insculpta*), eastern spiny softshell (*Apalone spinifera spinifera*), northern ribbon snake (*Thamnophis sauritus septentrionalis*), and eastern milk snake (*Lampropeltis triangulum*). Species at risk are discussed in detail in Section 3.7.

One species of reptile was observed during field work, the eastern garter snake (*Thamnophis sirtalis sirtalis*), which is a common species and considered secure in Ontario. Two individuals were observed between avian point counts 1 and 2 in oldfield habitat, between Jones Road and Glover Road.

Tables listing mammal and herptile species observed during fieldwork or having the potential to occur in the Study Area, along with conservation status are presented in **Table B.3** in **Appendix B**.

Invertebrates

No records for rare invertebrate species in or near the Study Area were indicated by NHIC Database information. A total of 7 species of lepidopterans were observed during field work including:

- Monarch (*Danaus plexippus*) (S2N, S4B);
- Question mark (*Polygonia interrogationis*) (S5);

- Cabbage white (*Pieris rapae*) (SNA - exotic);
- Sulphur sp. (*Colias* sp.);
- Eastern tailed blue (*Everes comyntas*) (S5);
- Virginian tiger moth caterpillar (*Spilosoma virginica*) (S5); and
- Northern crescent (*Phyciodes cocyta*) (S5).

In addition, two species of odonates were observed during field work:

- Green darner (*Anax junius*) (S5); and
- Black saddlebags (*Tramea lacerata*) (S4)

All of the invertebrates observed are considered secure in Ontario with the exception of the monarch butterfly, which is listed federally and provincially as Special Concern. Species at risk are discussed in detail in Section 3.7.

3.6 Fisheries Survey

The results of recent field work undertaken on May 25, 2009 are provided in this section, with references to photographs provided in **Appendix C** and corresponding locations on **Figure 2.1**.

Watercourse #5

This system drains northerly towards Lake Ontario adjacent to Fruitland Road and has been significantly altered to accommodate surrounding land uses. In the Study Area, Watercourse #5 is a permanently flowing system with habitat conditions indicative of degraded, warmwater systems. The channel generally conveys flow from south to north, emptying into a private boat harbour at Lake Ontario approximately 1.3km downstream. Major crossings of Watercourse #5 include the Queen Elizabeth Way (QEW), a railway, South Service Road, and Arvin Avenue. As previously stated, 3 representative sections (approx. 100m each in length) were selected to assess Watercourse #5 and are described in detail below (**Figure 2.1** shows the locations of all three sections).

Downstream Section

Dillon (November 2007) previously assessed this section in the Study Area, in addition to the May 2009 field work.

This reach has been realigned to accommodate surrounding land use and has a bankfull width of approximately 4 – 5m and an average wetted width of 1.0 - 2.0m (at the time of survey). Average water depths were between 0.10 and 0.15m, which flowed along a straightened channel over a clay-based substrate comprised of a mixture of sand, gravel, cobble, and a little rock. Available in-stream cover throughout this reach is low to moderate, consisting primarily of coarse woody debris and boulders. No significant refuge areas or sensitive habitat were noted along this reach.

The riparian community was characterized by poor to moderate tree and shrub cover. This includes open, partly open and dense canopy areas providing varying degrees of shading to the watercourse. This reach appears to have the potential to function as direct fish habitat; however, due to constraints to fish movement further downstream, lack of decent refuge pools, and the distance from the lake to this reach, it is likely that this reach only provides an indirect value to fisheries downstream.

The channel was observed to be predominantly flat habitat with very slow current (appeared stagnant) through slightly unstable banks and abundant in-stream debris (**Photo 1**). Previous documentation has indicated that flow within Watercourse #5 is highly variable and sensitive to runoff events. In the upstream portion of this reach, the channel was inundated with thick green algae and organic debris throughout (**Photo 2**).

Middlestream Section

Similar to the downstream section, this section has been historically altered to accommodate surrounding land use and required drainage. The channel has a bankfull width of approximately 2 – 3m and an average wetted width of 1.0 - 1.5m (at the time of survey). Average water depths were between 0.10m and 0.15m, with flow being conveyed along a straightened and deepened channel over a clay-based substrate comprised of a mixture of silt, cobble, boulder and some debris on top. Flow definition along this reach was characterized as being permanent and generally divided as approximately 90% flat, 5% riffle, and 5% run (**Photo 3**).

This Middlestream Section appears to experience significant increases in flow volume and velocity based on obvious scouring and the observed high-water mark. The stream banks were observed to be slightly unstable with abundant tree and shrub root systems visible. This section has decent canopy cover; however, available in-stream cover is low to moderate overall and primarily consisting of in-stream and overhanging coarse woody debris, anthropogenic debris (e.g., garbage, yard waste etc) and cobble (**Photo 4**). This section exhibited very little in-stream vegetation; however, abundant green algae and overhanging bank vegetation was present throughout. No significant refuge areas or sensitive habitat were noted along this reach.

Upstream Section

Similar to the other sections downstream, this section has also been altered to accommodate surrounding land uses and required drainage. The channel has an average bankfull width of approximately 1.2 – 3m and an average wetted width of 0.5 - 1.5m (at the time of survey). Average water depths were between 0.05m and 0.20m, and flow was conveyed through a straightened channel. Substrates were comprised of a mixture of clay, silt, gravel, cobble, with boulder on top. Flow definition along this reach was characterized as being permanent and generally divided as approximately 70% flat, 5% riffle, and 25% run (**Photo 5**).

Similar to downstream reaches, this Upstream Section also appears to experience significant fluctuations in flow volume and velocity based on scour lines and the high-water mark along the banks. The stream banks are generally shallow and do not appear to be able to contain periods of high flow as evident by flow erosion observed beyond the bankfull width. This section has decent canopy cover; however, available in-stream cover is low overall and primarily consists of in-stream and overhanging coarse woody debris, organic debris (e.g., natural and yard waste) and inorganic debris (e.g., tires and metals) (**Photo 6**). This section exhibited little to no in-stream vegetation and numerous seasonal barriers were observed due to the build-up of debris in combination with shallow water conditions present. No significant refuge areas or sensitive habitat were noted along this reach.

Electrofishing was undertaken where possible in places where fish are most likely to reside within the three sections discussed above. After 803 seconds of fishing effort, no fish were captured or seen during sampling. This result was not unexpected considering the previous classification of indirect habitat status within Watercourse #5 (Dillon, 2007). Due to numerous alterations, in-stream barriers present throughout Watercourse #5, and results of recent fish community sampling, it appears that Watercourse #5 does not function as direct fish habitat, but rather has an indirect function.

Tributary to Watercourse #5

This small tributary to Watercourse #5 drains to the north and into a storm sewer at Barton Street. As a result, the reach within the Study Area is orphaned and cannot function as direct fish habitat. The online storm sewer also significantly limits the potential for this watercourse to function as indirect habitat due to the physical and hydraulic separation of reaches. At the time of investigation, the channel was completely dry and functions as ephemeral overland drainage only. The channel itself is narrow and shallow with terrestrial vegetation growing throughout (**Photo 7**).

Electrofishing was not undertaken due to the absence of water at the time of investigation and inability of fish to access the Study Area via this channel.

Watercourse #6

Similar to Watercourse #5, this system drains northerly towards Lake Ontario and has been significantly altered and rerouted to accommodate surrounding land uses. In the Study Area, Watercourse #6 appeared to be a permanently flowing system with habitat conditions indicative of degraded, warmwater systems. The channel generally conveys flow from south to north, emptying into Lake Ontario, approximately 1.8km downstream. Major crossings of Watercourse #6 also include the QEW, a railway, and South Service Road.

Dillon (November 2007) previously assessed habitat conditions of Watercourse #6 near Barton Street within the Study Area. The following description is based on previous work and the May 2009 field work for the current investigation.

This reach has been straightened to accommodate the surrounding residential properties. This reach exhibits an average bankfull width of approximately 5 – 6 m and an average wetted width between 0.5 – 1.5 m (at the time of survey). Average water depths were typically less than 10 cm, which flowed along a straightened channel over a diverse substrate comprised of a mixture of gravel, cobble, rock, and boulder. Flow definition along this reach appeared permanent and flashy, with a morphology consisting of approximately 70% run and 30% riffle.

This portion of the watercourse appears to be in a fairly good condition with clear water, stable banks, decent canopy cover, good riffle/run definition and lack of visible in-stream barriers. Available in-stream cover throughout this reach is low consisting of only a limited amount of coarse woody debris and in-stream rock. No significant refuge pools or sensitive habitat were noted along this reach.

There is limited to no vegetation beyond the top-of-bank as the watercourse travels between residential homes. Conditions further upstream and towards the south end of the Study Area were predominantly flat with very slow current (appeared stagnant at times) and abundant algae (**Photo 8**). The wetted width in this area was approximately 1 - 2m with depths ranging between 0.10m and 0.25m. In-stream cover was abundant and provided in the form of coarse woody debris and algal mats (**Photo 9**). The substrate in many areas, especially through the wooded reaches, consisted mainly of cobble and boulder on consolidated clay. In addition, the banks were slightly eroding with an abundance of low-flow barriers (i.e., debris piles) and exposed tree and shrub root systems (**Photo 10**). This main differences in habitat between upstream and downstream reaches can be attributed to the general topography of the area (i.e., flat and thus more depositional upstream) and increased exposure to sunlight. Channel morphology towards Barton Street was more riffle/run in nature due to sloping topography and significant constriction of the channel to fit between adjacent residential properties. This modification has increased flow considerably through this section (**Photo 11**).

Based on recent field investigations, habitat conditions observed in the Study Area have the potential to sustain fish populations; however due to documented permanent barriers and obstructions/diversions further downstream and the lack of decent refuge habitat and consistent depth within the Study Area, Watercourse #6 appears to function primarily as indirect habitat to downstream aquatic resources at the shoreline of Lake Ontario.

<u>Watercourse #6.1</u>
This intermittent reach has been channelized and has a bankfull width ranging from approximately 2 - 4 m. The average wetted width was between 0 – 0.3 m (at the time of survey) and water depth ranged from 0-10 cm. The substrate included primarily manicured lawn and leaf litter from the adjacent residential yard. There is essentially no in-stream cover or overhead (riparian) cover along this portion of Watercourse 6.1. Stream banks are primarily covered with mowed lawn grasses.

Based on the 2009 field work, the watercourse within the Study Area functions as overland drainage only and does not function as direct fish habitat (**Photo 12**).

Watercourse #7

This watercourse drains northeasterly towards Lake Ontario and similar to the other watercourses described above, having been altered/rerouted to accommodate surrounding land uses. At the time of investigation, flow was apparent downstream of Highway 8 and contains habitat conditions indicative of degraded, warmwater systems. This creek generally conveys flow from southwest to north-northeast, discharging into Lake Ontario approximately 2km downstream.

At time of investigation, this watercourse contained water downstream of Highway 8 but was dry upstream of the highway. North of Highway 8, flow was primarily flat and was observed to have a wetted width ranging from 1 to 2m and an average water depth of approximately 0.1 – 0.20m. Water was stagnant within moderately unstable banks with a poorly defined low-flow channel, which appears to dry up during the summer months. Substrates primarily consisted of silt, sand, and boulder on a consolidated clay base. In-stream cover for fish was abundant and provided mainly in the form of overhanging vascular plants, boulders, and large woody debris (**Photo 13**). Towards the Glover Road crossing, the watercourse exhibited greater flow and generally contains run-type habitat over a cobble/gravel substrate on a clay base. This section closer to Glover Road is well shaded; however, available in-stream cover is less and the channel is more narrow (**Photo 14**). The watercourse accepts additional baseflow from the adjacent western ditchline of Glover Road and was flowing considerably at the time of investigation.

As previously stated, white sucker populations are known to occur between Barton Street and Lake Ontario (Philips, 2003). As such, it is possible that they occur within the Study Area also; however, only likely during the spring months as this branch is known to flow intermittently and may dry up later during the year (Philips 2003). Results of recent habitat investigations indicate that the potential for direct habitat exists provided access into the Study Area is possible.

3.7 Species at Risk & Species of Management Concern

3.7.1 Plants

No plant species at risk or species of possible management concern were observed in the Study Area.

3.7.2 Herptiles

Background review suggests the potential presence of herptile species at risk in the Study Area. None of these species were observed during field work, and the preferred habitat for several of these species is not found within the Study Area. Based on the NHIC database, Ontario Herptofaunal Atlas and field work, our evaluation suggests that three species may possibly use portions of the Study Area as primary habitat or as a travel corridor including: Blanding's turtle, Jefferson salamander and the eastern milksnake. Details regarding these species are provided below.

- Blanding's turtle (*Emydoidea blandingii*) (S3)
    - The Blanding's turtle is listed as *Threatened* both provincially and federally. The COSEWIC Assessment and Status Report indicates that "*Subpopulations are increasingly fragmented by the extensive road network that criss-crosses all of this turtle's habitat. Having delayed age at maturity, low reproductive output and extreme longevity makes this turtle highly vulnerable to increased rates of mortality of adults. Nesting females are especially susceptible to road kill because they often attempt to nest on gravel roads or on shoulders of paved roads. Loss of mature females in such a long-lived species greatly reduces recruitment and long-term viability of subpopulations. Another threat is degradation of habitat from development and alteration of wetlands. The pet trade is another serious ongoing threat because nesting females are most vulnerable to collection"* (COSEWIC, 2005).
    - Preferred habitats for this species are shallows, ponds and marshes with soft bottoms and abundant aquatic vegetation. An individual turtle may use several connected lakes, rivers, streams, marshes, or ponds and travel upwards of 6,760m in a season (COSEWIC, 2005). The Blanding's turtle nests in a variety of loose substrates including sand, organic soil, gravel

and cobblestone. Overwintering occurs in permanent pools that average about one metre in depth, or in slow flowing streams (COSEWIC, 2005).

- There are no shallow bodies of water within the Study Area; however, watercourses flowing through the Study Area could potentially provide a corridor for dispersal during nesting activity.

- Jefferson salamander (*Ambystoma jeffersonianum*) (S2)
  - The Jefferson salamander is listed as *Threatened* both provincially and federally. Threats to this species are largely related to anthropogenic factors. Urbanization, forestry activities, recreation and unauthorized collections are all attributable to their current status. Urban development creates barriers (e.g. roads, neighbourhoods, etc.) that limit the dispersal of the species and fragment their habitat, especially cutting off breeding ponds from late summer and winter habitat. Also, development impacts such as site clearing, reduced topography, storm water management, increased impermeable surface, altered water balance regimes, etc., affect soil moisture and the availability of vernal ponds which are essential to the survivability of the species.
  - Preferred habitat for this species is in moist, loose soil, under logs or in leaf litter within deciduous forests. In the spring, Jefferson salamanders travel to woodland ponds, limestone sinkhole ponds, kettle ponds and other natural basins to breed. These ponds are often ephemeral being fed by temporary water sources.
  - No ephemeral ponds were identified in deciduous forest habitat; however, the study team had very restricted access to the Study Area during spring months and searches were limited. Deciduous woodlands are present within the Study Area and may be potential habitat area.

- Eastern milksnake (*Lampropeltis triangulum*) (S3)
  - Milksnakes are federally and provincially listed as a species of *Special Concern*. Roads are a significant source of mortality for this species at risk. As habitat is lost and they come into increasing contact with people, this snake is often mistaken for a venomous species and deliberately killed.

    - This species of snake is considered *Common* in the Hamilton area, and especially in the rural parts of the City according to the Hamilton Natural Areas Inventory 2003 (Dwyer, 2003).
    - Milksnakes have broad habitat preferences being found in a wide variety of environments from rocky outcrops and hillsides to meadows and pastures. These snakes are usually found around coniferous or deciduous forest edges, but can thrive in a variety of habitat types, such as open woodlands, fields, farm buildings, and in older urban areas.
    - Suitable habitat for eastern milksnake can be found throughout the Study Area.

In addition, the Herpetofaunal Atlas indicates the possible presence of additional species at risk in the vicinity of the Study Area. Based on habitat requirements, suitable habitat is not found within the Study Area. Details regarding this additional species is provided below.

- Wood turtle (*Glyptemys insculpta*) (S2)
    - This species is federally and provincially listed as *Endangered*.
    - Hamilton Natural Areas Inventory 2003 (Dwyer, 2003) has the wood turtle listed as an *Excluded Species* because of historical one-time sightings in 1958; and this species was not sighted previously nor has it been observed since.
    - Preferred habitat for this species is clear rivers, streams or creeks with a slight current and sandy or gravelly bottom, with adjacent woody area providing sufficient cover.
    - As the watercourses present within the Study Area are highly impacted with degraded bottoms, suitable habitat is not found on-site.

- Eastern spiny softshell turtle (*Apalone spinifera spinifera*) (S3)
    - This species is federally and provincially listed as *Threatened*.
    - Preferred habitat for this species is lakes and large rivers. They rarely travel far from the shoreline.
    - This specific habitat is not found within the Study Area.

- Common musk turtle (*Sternotherus odoratus*) (S4)

- This species is federally and provincially listed as *Threatened*.
- Preferred habitat for this species includes a range of shallow water bodies with slow currents including lakes, streams, marshes, ponds and rivers, usually with a high organic substrates.
- The degraded and small marsh and stream habitats located in the Study Area do not contain suitable substrates for this species.

- Northern ribbonsnake (*Thamnophis sauritus septentrionalis*) (S3)
  - This species is federally and provincially listed as *Special Concern*.
  - Preferred habitat for this species is near bodies of water along the shoreline and in marshes.
  - This specific type of habitat is limited within the Study Area and of a lower quality than typically attracts this species.

3.7.3 Mammals

No mammals species at risk or species of possible management concern were observed in the Study Area.

3.7.4 Birds

A search of the Ontario Breeding Bird Atlas (2001-2005) showed potential breeding evidence for 5 avian species at risk within atlas square 17PH08. During fieldwork, two chimney swift (*Chaetura pelagica*) (*Threatened*) individuals were observed:. This species and the four others potentially occurring in the Study Area are discussed below.

- Chimney swift (*Chaetura pelagica*) (S4B SZN)
  - The chimney swift is federally and provincially listed as *Threatened*. COSEWIC stipulates that the primary cause of the recent decline in this species is unknown, but the decline in flying insects and a shift to homes that lack suitable nesting chimney's could be attributable.
  - This species is listed as *Uncommon* in the Hamilton area with observation largely limited to within the city and surrounding towns.
  - Formerly, preferred habitats for this species were tree cavities in old growth forests; however, due to reduced mature forest cover over much of its range this species is now more likely to be found in urban areas where they nest in manmade structures such as chimneys (COSEWIC 2007a).

Thus, potential nesting habitat can be found surrounding the Study Area. Chimney swift would be most likely to be found high above the Study Area, aerially foraging.

- Canada warbler (*Wilsonia Canadensis*) (S4B)
  - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. A reduction of forests with appropriate dense shrub and ground cover can be attributed to their decline. They also face added pressure through widespread deforestation of wintering grounds in South America.
  - This species is listed as *Rare* in the Hamilton area and they appear to be declining according to the Breeding Bird Atlas results.
  - Preferred habitat for the Canada warbler is usually wet mixed forests with a dense shrub layer but it can use a variety of wet wooded sites. They nest on or near the ground on fallen logs along stream banks or on hummocks (COSEWIC 2008a). Though, small watercourses flow through some of the woodlots located in the Study Area, they are generally not wet sites and have few conifers. Breeding habitat suitability in the Study Area for Canada Warbler should be considered low. This species was not observed during breeding bird surveys completed as part of this study.

- Red-headed woodpecker (*Melanerpes erythrocephalus*) (S4B)
  - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. The main threats for the red-headed woodpecker are habitat loss due to forestry and agriculture, and also increased competition from European starlings for nest sites.
  - This species is listed as *Rare* in the Hamilton area and appears to be declining.
  - Preferred habitat for this species is open woodland and woodland edges. They are often found along the forested edges of parks, golf courses, orchards and in riparian forests, especially where there is a higher density of dead trees (COSEWIC 2007b).
  - Potential breeding habitat for red-headed woodpecker, in the form of forest edge and active and abandoned orchards, is present in the Study

Area. This species was not observed during breeding bird surveys completed as part of this study.

- Common nighthawk (*Chordeiles minor*) (S4B)
  - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. The use of pesticides is a large threat to the nighthawk population as insects are their primary food source.
  - This species is listed as *Rare* in the Hamilton area represented by only one or two breeding pairs in the Hamilton area (Dwyer, 2003).
  - Preferred habitat for the common nighthawk includes a variety of open areas with little to no ground cover. Logged areas, burn-over areas, forest clearings, lakeshores, cultivated field and orchards can be used (COSEWIC 2007c).
  - Suitable open breeding habitats for common nighthawk can be found throughout the Study Area. This species was not observed during breeding bird surveys completed as part of this study.

- Short-eared owl (*Asio flammeus*) (S2N S4B)
  - The short-eared owl is listed as *Special Concern* both provincially and federally. Increased urbanization and intensive agricultural practices have led to decreases in suitable habitat and has been responsible for its current status.
  - This species is listed as *Rare* in the Hamilton area with the latest breeding observations in the Atlas being the only modern observation of this particular species.
  - Preferred breeding habitats for this species include a variety of open areas including grasslands, old pastures and marshes. Potential breeding habitat for short-eared owl can be found throughout the Study Area in the form of large oldfields and areas of marsh. This species was not observed during breeding bird surveys completed as part of this study.

3.7.5 Invertebrates

The monarch (*Danaus plexippus*) was the only invertebrate species at risk observed during field surveys. The monarch is listed as *Special Concern* both federally and provincially. This species is a migratory butterfly that spends summers in North

America, including southern Canada, and winters in Mexico. Threats to this species include pesticide use, general habitat loss and degradation throughout its range and specific threats to restricted wintering habitats in Mexico and California. Monarch can be found in a variety of habitats provided that milkweed is present, as this plant species is required by monarch caterpillars (SARA Public Registry 2009). Milkweed was observed in the Study Area and the presence of monarch individuals confirms that suitable habitat for this species is present.

4. NATURAL ENVIRONMENT CONSTRAINTS

4.1 Basis for Determining Constraints

The evaluation of constraints was completed using a natural heritage system (NHS) based approach and relied on provincial as well as municipal policy and legislation to direct protection for the long-term. A NHS is defined in the Provincial Policy Statement (2005) as a system made up of natural heritage features and areas, linked by natural corridors necessary to maintain biological and geological diversity, natural functions, viable populations of indigenous species and ecosystems. These systems can include lands that have been restored and areas with the potential to be restored to a natural state.

The local NHS is anchored by the Niagara Escarpment, Lake Ontario, Hamilton Harbour and Cootes Paradise, which connects the many wetlands, woodlands, streams and meadows found throughout the City's rural and open space areas. The east portion of the Study Area has been identified as part of the Protected Countryside in the Greenbelt Plan. The Study Area is also connected to lands within the Niagara Escarpment Plan Area located south of Highway 8.

Terrestrial
For terrestrial resources, constraint ratings of high, medium and low were assigned to the outer edge of an individual feature in a manner that reflected the protection provided or implied by the Provincial Policy Statement, Greenbelt Plan and/or the City of Hamilton Urban/Rural Official Plan.

High Constraint areas are considered to be natural features with the highest quality habitat in the Study Area and have specific attributes, which meet long-term protection requirements recommended by provincial or municipal policies/legislation (e.g. PPS, Official Plan, etc). Natural Features in this constraint level generally correspond to Core Natural Areas as defined in the City of Hamilton Discussion Papers 1, 1b, 3, 4a and 4b.

Medium Constraint areas are considered to be important natural features which should receive long-term protection to protect the diversity, connectivity and biodiversity of the natural heritage system. This designation recognizes the important function of maintaining linkages between and among natural heritage and surface water features to ensure the long-term ecological function of the natural system. Natural features in this constraint level are typically isolated remnant natural features that provide important habitat but do not meet the criteria for Core Areas or are smaller patches of various habitat types and quality that do to their proximity to Core Areas, provide valuable linkage opportunity and improve overall function of Cores Areas (e.g. size, shape, etc.). The function of these linkage areas may be significantly increased over time through restoration.

Low Constraint areas are considered to be of less importance to the long-term function of the natural heritage system and are not specifically protected by provincial or municipal policies or legislation.

Aquatic

According to OP *Section 2.5.7*, Streams are mapped in Schedule B - Natural Heritage System and have been separated into two classes: Coldwater Watercourse/Critical Habitat and Warmwater Watercourse/Important/Marginal Habitat. For the purposes of this general assessment of aquatic and fisheries resources within the Study Area, the guidance document developed by Credit Valley Conservation (CVC) and Toronto and Region Conservation Authority (TRCA) entitled, “Evaluation, Classification and Management of Headwater Drainage Features – Interim Guidelines” (CVC and TRCA, 2009) was also applied to the subject watercourses in the Study Area in order to recommend specific management objectives and help protect and delineate suitable constraints for development.

It is noteworthy that these guidelines would normally be applied following site-specific detailed fieldwork that also include hydraulic and fluvial geomorphic assessments; however, they were applied in this general context as a tool to provide an indication of potential protection requirements regarding aquatic habitat in the Study Area.

4.2 Constraint Designations

Terrestrial

Table 3 below provides a category of the feature requiring protection, specific features to be protected, recommended constraint level and overall rationale for assigning constraints. Proposed constraints and linkages are identified on Figure 4.1.

Table 3 - Natural Environment Constraint Analysis for the Fruitland Road Study Area.

Category	Features	Constraint Level	Rationale
Provincial Policy Areas	• Greenbelt – Protected Countryside **Key Natural Heritage Feature** • Fish Habitat; and • Significant Woodlands; **Key Hydrologic Feature** • Permanent and Intermittent Streams; and • Wetlands	High	Provides a continuous and permanent land base necessary to support human and ecological health in the Greenbelt.
	• Greenbelt – Protected Countryside (Outside KNHF or KHF)	Low	Culturally influenced features (e.g. agricultural lands, hedgerows, cultural thickets/meadows, etc.) in the Greenbelt.
Core Areas - Official Plan (based on Provincial Policy Statement)	• Wetlands (evaluated and unevaluated); • Fish Habitat; • Significant Woodlands; • Hazard Lands (e.g. floodplain)	High	Municipally protected areas that are recognized for their ecological value, fish habitat and hazard mitigation function.
Linkage Area - Official Plan (contiguous to natural features)	• Natural Vegetation Linkages: o Woodlands; o Meadows; o Thickets; and o Riparian Areas (i.e. streams)	Medium	Provide important ecological functions and services as well as function as ecological connections between Core Areas and other natural features, especially given their proximity to the urban environment.
Other Natural Vegetation Resources	• Other Natural Vegetation: o Woodlands (>0.5 ha).	Medium	Provide supportive ecological functions and services, especially given their proximity to the urban environment.
Rural/Urban Land-use (non-naturalized)	• Agricultural Lands • Hedgerows • Other cultural/developed land uses (e.g. cultural thickets/meadows, plantations, etc.)	Low	Recently modified communities with altered physiognomy, having lower biodiversity value than intact natural communities

Key Natural Heritage and Key Hydrologic Features

As directed by the 2005 PPS, local planning objectives for the Natural Heritage System focus on protecting and restoring key natural features and functions as a permanent environmental resource for the community. Through conformity with provincial plan objectives, the City has identified key natural features (e.g. Core Areas and Linkages) in the Study Area that warrant similar consideration. Dillon has also evaluated the Study Area for the presence of Key Natural Heritage Features (KNHF) and Key Hydrologic Features (KHF).

Through field investigation and examination of the City's Natural Heritage System, identified on City's Official Plan (OP) Schedule B, it was determined that the Study Area contains lands provincially classified as KNHF (e.g. Significant Woodlands and Fish Habitat) and KHF (e.g. Wetlands and Streams). KNHF and KHF are provincially significant, and as a result, are a high constraint to development.

Core Areas

Core Areas in the Study Area are the KNHF and KHF that have been identified within and outside the Greenbelt using provincial evaluation criteria and secondary source information (e.g. Schedules B1-8 - Detailed Natural Heritage Features). These significant natural features in the Study Area include: Significant Woodlands, Wetlands, Fish Habitat and Hazard Lands. Core Areas are the most important components in terms of biodiversity, productivity, and ecological and hydrological functions. According to OP *Section 2.3.3, the natural features and ecological functions of Core Areas shall be protected and enhanced. To accomplish this protection and enhancement, vegetation removal and encroachment into Core Areas shall generally not be permitted, and appropriate vegetation protection zones shall be applied to all Core Areas.* As such, Core Areas are a high development constraint (Figure 4.1).

Significant Woodlands

Significant Woodlands are areas which have ecologically important in terms of:

a) Features such as species composition, age of trees, stand history;
b) Functionally important due to its contribution to the broader landscape because of its location, size, or due to the amount of forest cover in the planning area; and
c) Economically important due to site quality, species composition or past management history (PPS, 2005).

The criteria for Significant Woodlands uses size, interior forest, proximity/connectivy to significant natural areas (e.g. wetlands >0.5 ha, ESAs, PSWs, and Life Science ANSIs), proximity to hydrologic features, tree stand age and presence of rare species. Based on an estimated 6% to 8% forest cover within the Stoney Creek Planning Unit (Hamilton Urban OP 2009), the minimum patch size for woodland significance is 2 ha. Beyond provincial policy, Significant Woodlands, including treed areas, woodlots or forested areas, are protected under the City's Woodland Conservation Bylaw. Accordingly, they are a high constraint to development.

Wetlands

A wetland is a swamp, marsh, bog, or fen (not including land that is being used for agricultural purposes and no longer exhibits wetland characteristics) that:

a) is seasonally or permanently covered with shallow water or has the water table close to or at the surface;
b) has hydric soils and vegetation dominated by water-tolerant plants;
c) has been further identified according to evaluation procedures established by the Ministry of Natural Resources, as amended from time to time; and
d) includes provincially and locally significant wetlands.

All wetlands, regardless of provincial significance, are a high development constraint.

Hazard Lands

Hazardous lands are property or lands that could be unsafe for development due to naturally occurring processes. Along stream systems, this means the land, including that covered by water, to the furthest landward limit of the flooding hazard or erosion hazard limits (PPS, 2005). In general, the land area designated as the natural heritage system extends beyond the limits of hazard lands. Hydrologic features in the Study Area that could present a flooding hazard to person or property are a high constraint to development.

Linkages

Linkages are remnant natural areas within the landscape that connect Core Areas to the NHS. Connections between natural areas provide opportunities for plant and animal movement, hydrological and nutrient cycling, and maintain ecological health and integrity of the overall Natural Heritage System. Linkages in the Study Area were identified through field assessments and examination of secondary source information (e.g. Schedule B1-8 - Detailed Natural Heritage Features).

Linkages in the Study Area include:

- woodland linkages (natural or planted wooded area of any size or composition of 0.5 hectares or more in size that either connects or lies within 100 metres of a Core Area);
- other natural vegetation types (e.g. meadows, old field, thickets); and
- streams and watercourses that connect Core Areas.

Due to their value in the NHS, Linkages are a medium constraint to development.

Other Natural Vegetation Resources

Other Woodlands (>0.5 ha)

Other Woodlands include treed areas, woodlots or forested areas and significant hedgerows within urban and rural settlement areas that provide potential environmental and economic benefits to both the private landowners and the general public. These potential benefits include: erosion prevention, hydrological and nutrient cycling, provision of clean air and the long-term storage of carbon, provision of wildlife habitat, outdoor recreational opportunities, and the sustainable harvest of a wide range of woodland products. Due to these benefits woodland greater than 0.5 ha are a medium development constraint.

Rural/Urban Land-use (non-naturalized)

With the exception of certain lands that have an ecological linkage function within the Greenbelt and adjacent to Core Areas, culturally altered vegetation communities such as cultural meadows, cultural thickets, agricultural lands and hedgerows are marginal, non-essential components of the natural heritage system. As a result, these rural/urban landuses are a low constraint to development.

Aquatic Constraints

The streams in the Study Area have been field verified and identified as warmwater. A warmwater watercourse is defined as a watercourse, whether permanent, intermittent, or ephemeral, which supports or contributes to the support of fish habitat or species associated with warmwater such as carp, bass, warmwater benthic invertebrates, or have thermal characteristics of a warmwater stream such as designated by the Ministry of Natural Resources. Warmwater species that are best adapted to prefer or usually occur at water temperatures greater than 25 degrees Celsius (Hamilton Urban OP, 2009).

The classification of warmwater watercourses in the Study Area have been further divided into permanent streams that provide direct fish habitat and intermittent streams that provide complex contributing fish habitat. Permanent and intermittent streams are a high and medium constraint to development, respectively.

Using Table 4 of the Interim Guidelines (CVC and TRCA, 2009), and the results from this study, environmental management recommendations can be determined for each drainage feature when applying the appropriate evaluation criteria. As such, the following habitat classifications and associated Management Recommendations were given to each of the watercourses in the Study Area:

<u>Watercourse #5</u>
Based on the habitat classification descriptions (as per the Interim Guidelines), Watercourse #5 is classified as permanent fish habitat in the Study Area. Based on a review of the Interim Guidelines combined with the findings of this study, it is recommended that this feature be given a **Protection 2** Management Recommendation. Although numerous barriers and obstructions exist on the system (e.g., downstream of Barton Street), the potential for direct habitat exists (should they be removed) and thus, it is believed that this level of protection is warranted.

According to the Interim Guidelines (CVC and TRCA, 2009), the Protection 2 Management Recommendation indicates the following general requirements for treatment of the watercourse:

Protection 2

- Preference is to maintain existing surface water source;
- Maintain external drainage or if catchment drainage has been previously removed due to diversion of SWM flows, restore lost functions through enhanced lot level controls (i.e. restore original catchment using clean roof drainage) as necessary;

- Replicate on-site surface water sources including wetland creation and incorporating extended detention outlets, if necessary;
- Use natural channel design techniques to replace and enhance existing habitat features only if features are easily replicated;
- Drainage feature must connect to downstream watercourse/habitat;
- Examine need to incorporate groundwater flows through infiltration measures (i.e. third pipes, etc.) to ensure no net loss and potential gain.

Tributary to Watercourse #5

Based on the habitat classification descriptions (as per the Interim Guidelines), this watercourse is classified as complex contributing fish habitat. However, as this tributary flows into a storm sewer and is isolated from downstream aquatic resources, it is recommended that this watercourse receive a **Mitigation 2** Management Recommendation.

According to the Interim Guidelines (CVC and TRCA, 2009), the Mitigation 2 Management Recommendation indicates the following general requirements for treatment of the watercourse:

Mitigation 2

- Replicate functions by lot-level conveyance measures (e.g., vegetated swales) connected to the natural heritage system, as feasible and/or Low Impact Development (LID) stormwater options;
- Replicate on-site flows and outlet flows at the top end of vegetated swales, bioswales, etc. to maintain feature functions.

Watercourse #6

Similar to Watercourse #5, this system is classified as permanent fish habitat (with in-stream barriers present downstream of the Study Area). It is therefore recommended that Watercourse #6 also be given a **Protection 2** Management Recommendation.

Watercourse #6.1

Based on the habitat classification descriptions (as per the Interim Guidelines), Watercourse #6.1 is classified in the Study Area as simple contributing fish habitat. As such, Table 4 of the Interim Guidelines indicates that this feature should be given a

Mitigation 2 Management Recommendation. This is primarily due to its ephemeral flow, defined channel with manicured grasses throughout.

Watercourse #7

Based on the habitat classification descriptions (as per the Interim Guidelines), Watercourse #7 is classified as permanent fish habitat in the Study Area. Based on a review of the Interim Guidelines combined with the findings of this study, it is recommended that this feature be given a **Protection 2** Management Recommendation. The potential for direct habitat exists within the Study Area and thus, it is believed that this level of protection is warranted.

Taken together, existing conditions at watercourses within the Study Area suggest that:

- Watercourses #5, 6 and 7 should be retained and protected;
- The function of the Tributary to Watercourse 5 should be maintained, but the watercourse may not need to be retained in its existing form;
- The function of Watercourse 6.1 should be maintained, but the watercourse may not need to be retained in its existing form.

5. FRUITLAND ROAD CLASS EA STUDY AREA

A Class EA is underway for improvements to Fruitland Road between Highway 8 and Barton Street. The purpose of this section is to present natural heritage information, potential impacts and mitigation considerations associated with the Fruitland Road proposed alternative corridors (**Figure 5.1**) for the purposes of the Fruitland Road Class EA. Survey locations are shown on Figure 5.2.

5.1 Natural Features Existing Conditions

5.1.1 Natural Features and Designations

Methods

Consultation with the Ontario Ministry of Natural Resources (MNR) (Art Timmerman – Guelph District Fish and Wildlife Biologist, Anne Yagi – Niagara Area Fish and Wildlife Biologist, Joad Durst – Niagara Area Office) and the Hamilton Conservation Authority (Shari Faulkenham – Ecologist, Tawnia Martel – Assistant Ecologist) was conducted as part of the initial background review. Information regarding Study Area natural features,

DILLON CONSULTING

relevant reports and digital mapping was requested and received from the Hamilton Conservation Authority. Response from the MNR was not received at the time of writing. A search of the Natural Heritage Information Centre (NHIC) database was conducted to confirm the presence or absence of designated Natural Areas (i.e. ANSI, ESA, Conservation Areas, etc.) within the Study Area. In addition, mapping showing the distribution of fish species at risk, as provided by Fisheries and Oceans Canada (DFO), were reviewed.

Relevant background reports reviewed included:

- City of Hamilton Watercourse 5 & 6 Class Environmental Assessment Study Draft Report (Dillon, 2007);
- Urban Hamilton Official Plan (City of Hamilton, 2009);
- Aquatic Habitat and Fisheries Impact Assessment – Watercourses 5, 6, 7, and 9 prepared for the City of Stoney Creek (SNC Lavalin, December 1991);
- The Ontario Greenbelt Plan (MMAH, 2005); and
- Nature Counts Project – Hamilton Natural Areas Inventory 2003 (Dwyer, 2003).

Results

Through consultation with Hamilton Conservation Authority and a search of the NHIC database, no designated Natural Areas (i.e. ANSI, ESA, Conservation Areas, etc.) were found within or directly adjacent to the Study Area. According to the Hamilton Conservation Authority, they do not have species or habitat information for the Study Area.

Review of the City of Hamilton Watercourse 5 & 6 Class Environmental Assessment Study Draft Report (Dillon 2007) found correspondence records outlining aquatic and terrestrial features within the Study Area. It is noted that, DFO and OMNR have identified Watercourses #5 as fish habitat. The Hamilton Conservation Authority also states that due to perched culverts and it is unlikely that they directly support a fish population, but they contribute as indirect fish habitat. In addition, communication with MNR for the aforementioned study revealed that no fisheries information exists for Watercourse #5.

Dillon (2007) confirmed with the MNR that *no provincially significant wildlife usage, woodlots, wetlands, or species at risk currently exist within the* watercourse 5 & 6 Study Area, which partially overlaps with the current Study Area. Further information specifically relating to watercourse 5 and associated aquatic habitat can be found in Section 5.1.6 of this report.

Review of the Urban Hamilton Official Plan found that the Study Area does not contain *Core Areas or Linkages*. Schedules B-5 and B-8 identify *Key Littoral Zones* and *Key Stream Features*, respectively. Within the Study Area, there are three small *Littoral Zone Features* and Watercourses #5 is designated as a *Key Stream Features*.

Immediately adjacent to the Study Area, south of Highway 8, the Niagara Escarpment Planning Area occurs (Schedule B – Rural Hamilton Official Plan). This section of the Niagara Escarpment Planning Area is designated as Protection Area (Schedule A – Rural Hamilton Official Plan). Land use for this area is designated as Specialty Crop (Schedule D – Rural Hamilton Official Plan).

5.1.2 Ecological Land Classification

Methods

During field investigations, which took place on August 6-7, 2009, vegetation communities were characterized using the MNR's Ecological Land Classification System for Southern Ontario (Lee *et al.* 1998). MNR vegetation type classification codes encompass the range of natural and cultural communities across southern Ontario as defined by their updated classification list as of December 2008. Natural and cultural vegetation community boundaries were determined through the review of aerial photography, and then further refined through on-site soil and vegetation studies.

Field data collection was undertaken in order to classify and map ecological communities to the vegetation level. The ELC system recommends that a vegetation community be a minimum of 0.5 ha in size before it is defined. Patches of vegetation less than 0.5 ha or disturbed/planted vegetation were occasionally described to the community level. In some instances, where vegetation is less than 0.5 ha, but appeared relatively undisturbed and clearly fits within an ELC vegetation type, the more refined classification was used. Where appropriate, a cultural classification was provided for dominant land uses in the Study Area, which help describe the natural environment. These cultural classifications are not meant to be consistent with or describe Official Plan Land Use or Zoning by-law designations.

Vegetation surveys involved identifying the dominant species in each vegetation community type based on visual estimates of species abundances, or, in the case of accessible forest stands, by quantitative sampling using a factor 2-wedge prism. Soil studies involved the examination of a 120 cm soil profile using a hand auger. Soil texture and moisture regime characteristics were documented. Other physical traits such as topography and slope were also noted, where relevant, within each community.

Results
The Study Area is comprised of a mixture of natural and cultural vegetation communities, ranging from deciduous forest/swamps to agricultural fields. With information gathered during field studies, vegetation communities were mapped on aerial photography according to ELC nomenclature to graphically represent the specific spatial pattern in the vegetation cover according to species composition, physiognomy, and physical site characteristics (see **Figure 5.3**).

Seven distinct ELC communities within the Study Area limits were identified to the vegetation level. These include:

- Fresh-Moist Green Ash Hardwood-Lowland Deciduous Forest (FODM7-2);
- Fresh-Moist Oak – Hardwood Deciduous Forest (FODM9-6);
- Fresh-Moist Mixed Meadow (MEMM4);
- Bulrush Gaminoid Mineral Meadow Marsh (MAMM1-15);
- Purple Loosestrife Forb Mineral Meadow Marsh (MAMM2-5);
- Green Ash Mineral Deciduous Swamp (SWDM2-2);
- Hawthorn (Dogwood/Buckthorn) Deciduous Shrub Thicket (THDM2-11);

Areas classified to the ELC community level documented in the Study Area include:

- Deciduous Woodlot (DECW)

Cultural areas documented in the Study Area include:

- Hedgerow (H).

According to the NHIC, vegetation units surveyed in the Study Area are considered Secure in the province of Ontario (S5). For a couple of naturally occurring vegetation classifications, no provincial status was available. From our experience, these un-rated vegetation units are common in Ontario. See **Table D.1** in **Appendix D** for detailed descriptions of each ELC community documented within the Study Area.

5.1.3 Botanical Survey

Methods

Botanical resources were assessed during the spring, summer and fall seasons, with surveys conducted on May 14 and 15, August 6 and 7 and September 10 and 11, 2009. Botanical surveys consisted of wandering transects through all available habitats to determine species presence within the Study Area. Plant species were documented by ELC communities and a complete list, including the status of individual species, is presented. Species nomenclature is based on the Ontario Plant List (Newmaster *et al.* 1998).

Results

In total, 146 flora species were identified within the Study Area during the spring and early summer of 2009. A full list of plant species encountered during field surveys, including the status of individual species, is presented in **Table D.2** in **Appendix D.** Of these, 64 (43.8%) are listed as exotic or non-native species. No plants observed are listed species under the federal *Species at Risk Act* or the provincial *Endangered Species Act*. A total of 6 (0.04%) of the species encountered have a coefficient of conservatism of 6 or greater. To put that into context, the coefficients of conservatism (CC) ranges from 0 to 10 and represents an estimated probability that a plant is likely to occur in a landscape relatively unaltered from what is believed to be a pre-settlement condition. For example, a CC of 0 is given to plants such as Manitoba maple (*Acer negundo*), which have demonstrated little fidelity to undisturbed sites (i.e. may be found almost anywhere). Similarly, a CC of 10 is applied to plants like shrubby cinquefoil that are almost always restricted to a pre-settlement remnant (i.e. a high quality natural area). Introduced plants were not part of the pre-settlement flora, so no CC value is applied to these. The 6 species with a coefficient of conservatism of 6 or greater found within the Study Area include:

- Shagbark hickory (*Carya ovata*);
- Spotted crane's-bill (*Geranium maculatum*);
- White spruce (*Picea glauca*);
- Red oak (*Quercus rubra*);
- Pasture rose (*Rosa carolina*); and
- Hardstem bulrush (*Scirpus acutus*);

5.1.4 Amphibians and Wildlife

Methods

Amphibian monitoring followed the Marsh Monitoring Program protocol (Bird Studies Canada, 1994). Monitoring was conducted on three different occasions during the spring breeding season according to calendar date and environmental conditions (i.e. temperature). Surveys involved standing at a station for 3 minutes and listening for frog calls. The calling activity of individuals estimated to be within 100m of the observation point were documented. All individuals beyond 100m were recorded as outside of the count circle and calling activity was not recorded. Calling activity was ranked using one of the following three abundance code categories:

Code 1: Calls not simultaneous, number of individuals can be accurately counted;
Code 2: Some calls simultaneous, number of individuals can reliably be estimated;
Code 3: Calls continuous and overlapping, number of individuals cannot be estimated.

In areas where appropriate habitat existed vernal pools were examined for egg masses and amphibian larvae, and if necessary, sampled with a dip net.

Five amphibian monitoring stations were surveyed during three survey events during the spring, see Amphibian Monitoring Stations 1 to 5 on **Figure 5.2**.

Results

Amphibians were monitored at five sites on April 17, May 13 and June 9, 2009. Survey point counts were located along public roads adjacent to areas where potential habitat could or did exist, as access to the interior portions of Study Area had not yet been attained.

Field work documented the presence of the western chorus frog (*Psudacris triseriata*) at three stations during the April 17 2009 site visit. **Table 4** shows dates observed, calling codes and numbers of individuals observed, where possible. Two additional species were recorded through incidental observations during other field studies including Northern leopard frog (*Rana pipiens*) and green frog (*Rana clamitans*). All amphibian species observed are considered common to very common in the Province of Ontario and not evaluated as at risk by COSEWIC or COSSARO. Locally, all species are considered as either C*ommon* or A*bundant* according to the Hamilton Natural Areas Inventory (Dwyer, 2003).

During field work, salamanders were actively searched for in areas where appropriate habitat existed; none were found. Appropriate habitat is considered to be deciduous forests with moist, loose soils, under logs/deadfall or in leaf litter and ephemeral pools. There are areas of deciduous forests within the Study Area, as described in the ELC; however, no ephemeral pools were observed during field studies when the study team had full access to the entire Study Area.

5.1.5 Wildlife

Methods

Breeding bird surveys were conducted in the Study Area on May 26th and 27th, and June 22nd and 23rd, 2009, with a total of 16 person-hours spent documenting the breeding bird community.

Surveys combined point count with area search methodology, which followed the Ontario Breeding Bird Atlas Guide for Participants (2001), to develop an overall species list for the Study Area. Five ten-minute fixed/non-fixed radius point counts were used to establish quantitative estimates of bird abundance in major habitat types of the Study Area. Point counts were sufficiently spaced (i.e. 100m from the edge of a habitat, spaced 250m apart in forested habitats and 500 m apart in open habitats so they did not overlap). For all point count locations, a GPS coordinate in NAD 83 was documented. Area searches were conducted by visiting each major habitat type during the breeding season, primarily between dawn and 5hrs after sunrise. Locations of point counts and area search routes are indicated on **Figure 5.2**. A summary list of all bird species encountered has been compiled and is presented.

Avian Community Results

Breeding bird surveys identified 52 species in the Study Area. Data from the 2nd Ontario Breeding Bird Atlas (BBA) indicates that a total of 103 bird species were found as possible, probable or confirmed breeders in atlas square 17PH08, which encompasses the Study Area.

The BBA data indicates that a total of 5 species at risk were found with breeding evidence in square 17PH08 during the second atlas project including short-eared owl (*Asio flammeus*), common nighthawk (*Chordeiles minor*), chimney swift (*Chaetura pelagica*), redheaded woodpecker (*Melanerpes erythrocephalus*) and Canada warbler (*Wilsonia canadensis*). Two individuals of chimney swift (*Chaetura pelagica*), which is federally and provincially listed as *Threatened*, were observed during field work. These birds were observed foraging in the air over the John Knox Christian school grounds near the Highway 8-Jones Road intersection. Species at risk are discussed in detail in Section 5.1.7.

Conservation Priority Species

The Conservation Priority for Birds of Southern Ontario report (Couturier, 1999) aims to help planning authorities set priorities for conservation efforts by targeting bird species (and their associated habitats) that are significant within their region. Specifically, this report advocates the use of prioritized lists of birds as tools that planning authorities might use when developing Official Plans (e.g., identifying significant wildlife habitat, Environmentally Sensitive Areas, etc.) and when evaluating development proposals.

Three distinct approaches have been used in establishing conservation priorities at the municipal level including Jurisdictional Responsibility, Preservation Responsibility, and Area Sensitivity. Each species breeding within each southern Ontario municipality is assigned a score for each of the three components. A species is added to the municipal priority list if it scores highly on at least one of the three individual components. A composite score is derived by summing the three individual scores and is used to rank species by conservation priority for planning purposes at the local level.

The list is designed to identify a broad group of species that represent a priority for conservation, based on the three components that make up the approach. Thus, the list is not intended to identify only rare species or species under immediate threat or in need of population restoration. Further, the approach is not designed to identify species that are indicators of ecosystem health or integrity. While many such species will undoubtedly be on the list, municipalities and others will be left with the job of deciding how to apply this information (Couturier, 1999).

Based on Appendix G – Master Priority Table for Southern Ontario (Couturier, 1999) we have determined that a total of 19 conservation priority species from the former Hamilton-Wentworth Region (which encompasses the Study Area) were observed during field surveys, including:

- Common loon (*Gavia immer*);
- American woodcock (*Scolopax minor*);
- American goldfinch (*Carduelis tristis*);
- Barn swallow (*Hirundo rustica*);
- Northern rough-winged swallow (*Stelgidopteryx serripennis*);
- Black-capped chickadee (*Poecile atricapillus*);

- Bobolink (*Dolichonyx oryzivorus*);
- Eastern meadowlark (*Sturnella magna*);
- Orchard Oriole (*Icterus spurious*);
- Eastern kingbird (*Tyrannus tyrannus*);
- Horned lark (*Eremophila alpestris*);
- Northern mockingbird (*Mimus polyglottos*);
- Field sparrow (*Spizella pusilla*);
- Savannah sparrow (*Passerculus sandwichensis*);
- Swamp sparrow (*Melospiza georgiana*);
- Clay-coloured sparrow (*Spizella pallida*);
- Mourning warbler (*Oporornis philadelphia*);
- American redstart (*Setophaga ruticilla*); and
- Yellow-rumped warbler (*Dendroica coronata*).

Area Sensitive Species

Area sensitivity is based on the concept that certain species of birds will require a larger amount of preferred habitat to consistently breed within a region. Conversely, species not considered as area sensitive can be found breeding throughout a region, regardless of the amount of a particular preferred habitat type (Couturier 1999). During breeding bird surveys, 12 species considered area sensitive open country birds were observed, including:

- Northern mockingbird (*Mimus polyglottos*);
- Barn swallow (*Hirundo rustica*);
- Northern rough-winged swallow (*Stelgidopteryx serripennis*);
- Clay-coloured sparrow (*Spizella pallida*);
- Savannah sparrow (*Passerculus sandwichensis*);
- Field sparrow (*Spizella pusilla*);
- American goldfinch (*Carduelis tristis*);
- Brown-headed cowbird (*Molothrus ater*);
- Eastern meadowlark (*Sturnella magna*);
- Bobolink (*Dolichonyx oryzivorus*);
- Eastern kingbird (*Tyrannus tyrannus*); and
- Horned lark (*Eremophila alpestris*).

Three area sensitive marsh species were observed during breeding surveys, including swamp sparrow, common loon (observed flying over the Study Area) and a small rail not identified to species (sora or Virginia rail, both of which are considered area sensitive).

One area sensitive forest species was observed during breeding surveys, including mourning warbler (*Oporornis philadelphia*).

A table of bird species observed during fieldwork along with conservation status is presented in **Table D.5** in **Appendix D**.

Other Wildlife Results

Mammals

Information from the Atlas of the Mammals of Ontario (Dobbyn 1994) indicates that 22 mammal species have been observed in the vicinity of the Study Area, all of which are considered secure in Ontario (see **Table D.3** in **Appendix D**). Of these, 6 species of mammals were observed during field work including: white–tailed deer (*Odocoileus virginianus*), raccoon (*Procyon lotor*), eastern cottontail (*Sylvilagus floridanus*), grey squirrel (*Sciurus carolinensis*), meadow vole (*Microtus pennsylvanicus*) and northern short-tailed shrew (*Blarina brevicauda*).

Herptiles

Ontario Herptofaunal Atlas information (Oldham and Weller 2000) indicates that 15 species of amphibian and 13 reptile species have been observed in the vicinity of the Study Area, including 7 species at risk: Jefferson salamander (*Ambystoma jeffersonianum*), common snapping turtle (Chelydra serpentina), Blanding's turtle (*Emydoidea blandingi*), wood turtle (*Clemmys insculpta*), eastern spiny softshell (*Apalone spinifera spinifera*), northern ribbon snake (*Thamnophis sauritus septentrionalis*), and eastern milk snake (*Lampropeltis triangulum*). Species at risk are discussed in detail in Section 5.1.7.

One species of reptile was observed during field work, the eastern garter snake (*Thamnophis sirtalis sirtalis*), which is a common species and considered secure in Ontario. Two individuals were observed between avian point counts 1 and 2 in oldfield habitat, between Jones Road and Glover Road.

Tables listing mammal and herptile species observed during fieldwork or having the potential to occur in the Study Area, along with conservation status are presented in **Table D.4** in **Appendix D**.

Invertebrates

No records for rare invertebrate species in or near the Study Area were indicated by NHIC Database information. A total of 7 species of lepidopterans were observed during field work including:

- Monarch (*Danaus plexippus*) (S2N, S4B);
- Question mark (*Polygonia interrogationis*) (S5);
- Cabbage white (*Pieris rapae*) (SNA - exotic);
- Sulphur sp. (*Colias* sp.);
- Eastern tailed blue (*Everes comyntas*) (S5);
- Virginian tiger moth caterpillar (*Spilosoma virginica*) (S5); and
- Northern crescent (*Phyciodes cocyta*) (S5).

In addition, two species of odonates were observed during field work:

- Green darner (*Anax junius*) (S5); and
- Black saddlebags (*Tramea lacerata*) (S4)

All of the invertebrates observed are considered secure in Ontario with the exception of the monarch butterfly, which is listed federally and provincially as Special Concern. Species at risk are discussed in detail in Section 5.1.7.

5.1.6 Fisheries Study

Fisheries field work was conducted on May 25, 2009. Due to site access issues and the overall length of Watercourse #5, three (3) representative reaches were selected and investigated in detail. They are known herein as the “Downstream Section”, “Middlestream Section”, and “Upstream Section.” For these sections, watercourse field record forms and habitat map forms were used to record detailed information, and photographs were taken to show existing conditions. Fish community surveys were conducted in the Watercourse #5 system, where conditions permitted, using a Model HT 2000B backpack electrofishing unit.

The results of the review of background information and field investigations were compared and used to summarize existing fish habitat conditions and to confirm the status of the fishery in each system (i.e., direct, indirect, or not fish habitat). In addition, this information was used to identify potential impact and mitigation considerations associated with Fruitland Road alternatives.

The results of recent field work undertaken on May 25, 2009 are provided in this section, with references to photographs provided in **Appendix C** and corresponding locations on **Figure 5.2**.

<u>Watercourse #5</u>
This system drains northerly towards Lake Ontario adjacent to Fruitland Road and has been significantly altered to accommodate surrounding land uses. In the Study Area, Watercourse #5 is a permanently flowing system with habitat conditions indicative of degraded, warmwater systems. The channel generally conveys flow from south to north, emptying into a private boat harbour at Lake Ontario approximately 1.3km downstream. Major crossings of Watercourse #5 include the Queen Elizabeth Way (QEW), a railway, South Service Road, and Arvin Avenue. As previously stated, 3 representative sections (approx. 100m each in length) were selected to assess Watercourse #5 and are described in detail below (**Figure 2.1** shows the locations of all three sections).

Downstream Section
Dillon (November 2007) previously assessed this section in the Study Area, in addition to the May 2009 field work.

This reach has been realigned to accommodate surrounding land use and has a bankfull width of approximately 4 – 5m and an average wetted width of 1.0 - 2.0m (at the time of survey). Average water depths were between 0.10 and 0.15m, which flowed along a straightened channel over a clay-based substrate comprised of a mixture of sand, gravel, cobble, and a little rock. Available in-stream cover throughout this reach is low to moderate, consisting primarily of coarse woody debris and boulders. No significant refuge areas or sensitive habitat were noted along this reach.

The riparian community was characterized by poor to moderate tree and shrub cover. This includes open, partly open and dense canopy areas providing varying degrees of shading to the watercourse. This reach appears to have the potential to function as direct fish habitat; however, due to constraints to fish movement further downstream, lack of decent refuge pools, and the distance from the lake to this reach, it is likely that this reach only provides an indirect value to fisheries downstream.

The channel was observed to be predominantly flat habitat with very slow current (appeared stagnant) through slightly unstable banks and abundant in-stream debris (**Photo 1**). Previous documentation has indicated that flow within Watercourse #5 is highly variable and sensitive to runoff events. In the upstream portion of this reach, the channel was inundated with thick green algae and organic debris throughout (**Photo 2**).

Middlestream Section

Similar to the downstream section, this section has been historically altered to accommodate surrounding land use and required drainage. The channel has a bankfull width of approximately 2 – 3m and an average wetted width of 1.0 - 1.5m (at the time of survey). Average water depths were between 0.10m and 0.15m, with flow being conveyed along a straightened and deepened channel over a clay-based substrate comprised of a mixture of silt, cobble, boulder and some debris on top. Flow definition along this reach was characterized as being permanent and generally divided as approximately 90% flat, 5% riffle, and 5% run (**Photo 3**).

This Middlestream Section appears to experience significant increases in flow volume and velocity based on obvious scouring and the observed high-water mark. The stream banks were observed to be slightly unstable with abundant tree and shrub root systems visible. This section has decent canopy cover; however, available in-stream cover is low to moderate overall and primarily consisting of in-stream and overhanging coarse woody debris, anthropogenic debris (e.g., garbage, yard waste etc) and cobble (**Photo 4**). This section exhibited very little in-stream vegetation; however, abundant green algae and overhanging bank vegetation was present throughout. No significant refuge areas or sensitive habitat were noted along this reach.

Upstream Section

Similar to the other sections downstream, this section has also been altered to accommodate surrounding land uses and required drainage. The channel has an average bankfull width of approximately 1.2 – 3m and an average wetted width of 0.5 - 1.5m (at the time of survey). Average water depths were between 0.05m and 0.20m, and flow was conveyed through a straightened channel. Substrates were comprised of a mixture of clay, silt, gravel, cobble, with boulder on top. Flow definition along this reach was characterized as being permanent and generally divided as approximately 70% flat, 5% riffle, and 25% run (**Photo 5**).

Similar to downstream reaches, this Upstream Section also appears to experience significant fluctuations in flow volume and velocity based on scour lines and the high-water mark along the banks. The stream banks are generally shallow and do not appear to be able to contain periods of high flow as evident by flow erosion observed beyond the bankfull width. This section has decent canopy cover; however, available in-stream cover is low overall and primarily consists of in-stream and overhanging coarse woody debris, organic debris (e.g., natural and yard waste) and inorganic debris (e.g., tires and metals) (**Photo 6**). This section exhibited little to no in-stream vegetation and numerous seasonal barriers were observed due to the build-up of debris in combination with shallow water conditions present. No significant refuge areas or sensitive habitat were noted along this reach.

Electrofishing was undertaken where possible in places where fish are most likely to reside within the three sections discussed above. After 803 seconds of fishing effort, no fish were captured or seen during sampling. This result was not unexpected considering the previous classification of indirect habitat status within Watercourse #5 (Dillon, November 2007). Due to numerous alterations, in-stream barriers present throughout Watercourse #5, and results of recent fish community sampling, it appears that Watercourse #5 does not function as direct fish habitat, but rather has an indirect function.

Tributary to Watercourse #5

This small tributary to Watercourse #5 drains to the north and into a storm sewer at Barton Street. As a result, the reach within the Study Area is orphaned and cannot function as direct fish habitat. The online storm sewer also significantly limits the potential for this watercourse to function as indirect habitat due to the physical and hydraulic separation of reaches. At the time of investigation, the channel was completely dry and functions as ephemeral overland drainage only. The channel itself is narrow and shallow with terrestrial vegetation growing throughout (**Photo 7**).

Electrofishing was not undertaken due to the absence of water at the time of investigation and inability of fish to access the Study Area via this channel.

5.1.7 Species at Risk

5.1.7.1 Plants

No plants species at risk or species of possible management concern were observed in the Study Area.

5.1.7.2 Herptiles

Background review suggests the potential presence of herptile species at risk in the Study Area. None of these species were observed during field work, and the preferred habitat for several of these species is not found within the Study Area. Based on the NHIC database, Ontario Herptofaunal Atlas and field work, our evaluation suggests that three species may possibly use portions of the Study Area as primary habitat or as a travel corridor including: Blanding's turtle, Jefferson salamander and the eastern milksnake. Details regarding these species are provided below.

- Blanding's turtle (*Emydoidea blandingii*) (S3)
    - The Blanding's turtle is listed as *Threatened* both provincially and federally. The COSEWIC Assessment and Status Report indicates that "*Subpopulations are increasingly fragmented by the extensive road network that criss-crosses all of this turtle's habitat. Having delayed age at maturity, low reproductive output and extreme longevity makes this turtle highly vulnerable to increased rates of mortality of adults. Nesting females are especially susceptible to road kill because they often attempt to nest on gravel roads or on shoulders of paved roads. Loss of mature females in such a long-lived species greatly reduces recruitment and long-term viability of subpopulations. Another threat is degradation of habitat from development and alteration of wetlands. The pet trade is another serious ongoing threat because nesting females are most vulnerable to collection*" (COSEWIC, 2005).
    - Preferred habitats for this species are shallows, ponds and marshes with soft bottoms and abundant aquatic vegetation. An individual turtle may use several connected lakes, rivers, streams, marshes, or ponds and travel

upwards of 6,760m in a season (COSEWIC, 2005). The Blanding's turtle nests in a variety of loose substrates including sand, organic soil, gravel and cobblestone. Overwintering occurs in permanent pools that average about one metre in depth, or in slow flowing streams (COSEWIC, 2005).

  - There are no shallow bodies of water within the Study Area; however, watercourses flowing through the Study Area could potentially provide a corridor for dispersal during nesting activity.

- Jefferson salamander (*Ambystoma jeffersonianum*) (S2)
  - The Jefferson salamander is listed as *Threatened* both provincially and federally. Threats to this species are largely related to anthropogenic factors. Urbanization, forestry activities, recreation and unauthorized collections are all attributable to their current status. Urban development creates barriers (e.g. roads, neighbourhoods, etc.) that limit the dispersal of the species and fragment their habitat, especially cutting off breeding ponds from late summer and winter habitat. Also, development impacts such as site clearing, reduced topography, storm water management, increased impermeable surface, altered water balance regimes, etc., affect soil moisture and the availability of vernal ponds which are essential to the survivability of the species.
  - Preferred habitat for this species is in moist, loose soil, under logs or in leaf litter within deciduous forests. In the spring, Jefferson salamanders travel to woodland ponds, limestone sinkhole ponds, kettle ponds and other natural basins to breed. These ponds are often ephemeral being fed by temporary water sources.
  - No ephemeral ponds were identified in deciduous forest habitat; however, the study team had very restricted access to the Study Area during spring months and searches were limited. Deciduous woodlands are present within the Study Area and may be potential habitat area.

- Eastern milksnake (*Lampropeltis triangulum*) (S3)
  - Milksnakes are federally and provincially listed as a species of *Special Concern*. Roads are a significant source of mortality for this species at risk. As habitat is lost and they come into increasing contact with people,

this snake is often mistaken for a venomous species and deliberately killed.
    - This species of snake is considered *Common* in the Hamilton area, and especially in the rural parts of the City according to the Hamilton Natural Areas Inventory 2003 (Dwyer, 2003).
    - Milksnakes have broad habitat preferences being found in a wide variety of environments from rocky outcrops and hillsides to meadows and pastures. These snakes are usually found around coniferous or deciduous forest edges, but can thrive in a variety of habitat types, such as open woodlands, fields, farm buildings, and in older urban areas.
    - Suitable habitat for eastern milksnake can be found throughout the Study Area.

In addition, the Herpetofaunal Atlas indicates the possible presence of additional species at risk in the vicinity of the Study Area. Based on habitat requirements, suitable habitat is not not found within the Study Area. Details regarding this additional species is provided below.

- Wood turtle (*Glyptemys insculpta*) (S2)
    - This species is federally and provincially listed as *Endangered*.
    - Hamilton Natural Areas Inventory 2003 (Dwyer, 2003) has the wood turtle listed as an *Excluded Species* because of historical one-time sightings in 1958; and this species was not sighted previously nor has it been observed since.
    - Preferred habitat for this species is clear rivers, streams or creeks with a slight current and sandy or gravelly bottom, with adjacent woody area providing sufficient cover.
    - As the watercourses present within the Study Area are highly impacted with degraded bottoms, suitable habitat is not found on-site.

- Eastern spiny softshell turtle (*Apalone spinifera spinifera*) (S3)
    - This species is federally and provincially listed as *Threatened*.
    - Preferred habitat for this species is lakes and large rivers. They rarely travel far from the shoreline.
    - This specific habitat is not found within the Study Area.

- Common musk turtle (*Sternotherus odoratus*) (S4)
  - This species is federally and provincially listed as *Threatened*.
  - Preferred habitat for this species includes a range of shallow water bodies with slow currents including lakes, streams, marshes, ponds and rivers, usually with a high organic substrates.
  - The degraded and small marsh and stream habitats located in the Study Area do not contain suitable substrates for this species.

- Northern ribbonsnake (*Thamnophis sauritus septentrionalis*) (S3)
  - This species is federally and provincially listed as *Special Concern*.
  - Preferred habitat for this species is near bodies of water along the shoreline and in marshes.
  - This specific type of habitat is limited within the Study Area and of a lower quality than typically attracts this species.

5.1.7.3 Mammals

No mammals species at risk or species of possible management concern were observed in the Study Area.

5.1.7.4 Birds

A search of the Ontario Breeding Bird Atlas (2001-2005) showed potential breeding evidence for 5 avian species at risk within atlas square 17PH08. During fieldwork, two chimney swift (*Chaetura pelagica*) (*Threatened*) individuals were observed:. This species and the four others potentially occurring in the Study Area are discussed below.

- Chimney swift (*Chaetura pelagica*) (S4B SZN)
  - The chimney swift is federally and provincially listed as *Threatened*. COSEWIC stipulates that the primary cause of the recent decline in this species is unknown, but the decline in flying insects and a shift to homes that lack suitable nesting chimney's could be attributable.
  - This species is listed as *Uncommon* in the Hamilton area with observation largely limited to within the city and surrounding towns.
  - Formerly, preferred habitats for this species were tree cavities in old growth forests; however, due to reduced mature forest cover over much of its range this species is now more likely to be found in urban areas where

they nest in manmade structures such as chimneys (COSEWIC 2007a). Thus, potential nesting habitat can be found surrounding the Study Area. Chimney swift would be most likely to be found high above the Study Area, aerially foraging.

- Canada warbler (*Wilsonia Canadensis*) (S4B)
    - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. A reduction of forests with appropriate dense shrub and ground cover can be attributed to their decline. They also face added pressure through widespread deforestation of wintering grounds in South America.
    - This species is listed as *Rare* in the Hamilton area and they appear to be declining according to the Breeding Bird Atlas results.
    - Preferred habitat for the Canada warbler is usually wet mixed forests with a dense shrub layer but it can use a variety of wet wooded sites. They nest on or near the ground on fallen logs along stream banks or on hummocks (COSEWIC 2008a). Though, small watercourses flow through some of the woodlots located in the Study Area, they are generally not wet sites and have few conifers. Breeding habitat suitability in the Study Area for Canada Warbler should be considered low. This species was not observed during breeding bird surveys completed as part of this study.

- Red-headed woodpecker (*Melanerpes erythrocephalus*) (S4B)
    - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. The main threats for the red-headed woodpecker are habitat loss due to forestry and agriculture, and also increased competition from European starlings for nest sites.
    - This species is listed as *Rare* in the Hamilton area and appears to be declining.
    - Preferred habitat for this species is open woodland and woodland edges. They are often found along the forested edges of parks, golf courses, orchards and in riparian forests, especially where there is a higher density of dead trees (COSEWIC 2007b).
    - Potential breeding habitat for red-headed woodpecker, in the form of forest edge and active and abandoned orchards, is present in the Study

Area. This species was not observed during breeding bird surveys completed as part of this study.

- Common nighthawk (*Chordeiles minor*) (S4B)
  - This species is listed as *Threatened* federally and listed as a species of *Special Concern* provincially. The use of pesticides is a large threat to the nighthawk population as insects are their primary food source.
  - This species is listed as *Rare* in the Hamilton area represented by only one or two breeding pairs in the Hamilton area (Dwyer, 2003).
  - Preferred habitat for the common nighthawk includes a variety of open areas with little to no ground cover. Logged areas, burn-over areas, forest clearings, lakeshores, cultivated field and orchards can be used (COSEWIC 2007c).
  - Suitable open breeding habitats for common nighthawk can be found throughout the Study Area. This species was not observed during breeding bird surveys completed as part of this study.

- Short-eared owl (*Asio flammeus*) (S2N S4B)
  - The short-eared owl is listed as *Special Concern* both provincially and federally. Increased urbanization and intensive agricultural practices have led to decreases in suitable habitat and has been responsible for its current status.
  - This species is listed as *Rare* in the Hamilton area with the latest breeding observations in the Atlas being the only modern observation of this particular species.
  - Preferred breeding habitats for this species include a variety of open areas including grasslands, old pastures and marshes. Potential breeding habitat for short-eared owl can be found throughout the Study Area in the form of large oldfields and areas of marsh. This species was not observed during breeding bird surveys completed as part of this study.

5.1.7.5 Invertebrates

The monarch (*Danaus plexippus*) was the only invertebrate species at risk observed during field surveys. The monarch is listed as *Special Concern* both federally and provincially. This species is a migratory butterfly that spends summers in North

America, including southern Canada, and winters in Mexico. Threats to this species include pesticide use, general habitat loss and degradation throughout its range and specific threats to restricted wintering habitats in Mexico and California. Monarch can be found in a variety of habitats provided that milkweed is present, as this plant species is required by monarch caterpillars (SARA Public Registry 2009). Milkweed was observed in the Study Area and the presence of monarch individuals confirms that suitable habitat for this species is present.

5.2 Fruitland Road Alternative Corridors

Approximate alternative corridor footprints for Fruitland Road are indicated on **Figure 5.1**. The corridor associated with Alternatives 2 and 4 involves a north-south corridor 360 m east of the existing Fruitland Road in the bottom half of the Study Area. Extending northerly, this corridor veers to the west and links with existing Fruitland Road to maintain local access. In contrast, the corridor associated with Alternative 5 shares a portion of the same footprint as the previously described corridor, but continues northerly in the northern half of the Study Area, adjacent to the Tributary to Watercourse #5 (**Figure 5.1**). It would be a new north-south collector road with a new Barton Street intersection.

5.3 Potential Impacts and Mitigation Considerations

In the sections below, a general discussion of potential terrestrial and aquatic impacts is provided, in addition to potential mitigation measures to be considered.

Potential Terrestrial Impacts and Mitigation Considerations

The road corridors associated with Alternatives 2 and 4 and Alternative 5 are located in predominantly open country mixed meadow and shrub thicket vegetation communities. These lands are mainly agricultural fields, hedgerows, vineyards or plantations that have been previously disturbed and allowed to regenerate into naturalized vegetation communities. Remnant natural vegetation communities were also documented in the Study Area and could be affected by one or both of the road corridor alternatives.

Road corridor Alternatives 2 and 4 and Alternative 5 have the potential to impact the terrestrial natural environment in the following manner:

- Encroachment/vegetation removal/geographic isolation of a small green ash mineral deciduous swamp that runs parallel to Watercourse #5 (Alternatives 2 & 4 only);
- Encroachment/vegetation removal/ habitat fragmentation in a fresh-moist oak-hardwood deciduous forest (Alternative 5 only);
- Loss of purple loosestrife (non-native) forb meadow marsh;
- Loss of trees in hedgerows and plantations;
- Introduction/colonization of non-native invasive flora in disturbance zones;
- Potential injury or disturbance to migratory birds (and their nests) protected under the *Migratory Birds Convention Act* (1994) and the *Fish and Wildlife Conservation Act* (1997);
- Increase in anthropogenic disturbances to open country habitat, including urban stressors such as noise, light, trampling, and dumping. These human disturbances can result in a loss of biodiversity in natural and cultural areas; and
- Hydrological impacts to wetland and lowland forest communities. Alteration to the hydrology in or immediately adjacent to natural vegetation communities could impact their form and function. Activities that could affect the hydrology of natural features include construction dewatering, alteration to surface water drainage patterns, changes to the water table and excessive pooling/drying along the road embankment.

The following mitigation measures are recommended to avoid or reduce the natural environment impacts of the Laurier Parkway road extension:

- Minimize the amount of area of vegetation removal to the extent possible.
- During the construction phase, establishing vegetation protection zones (VPZ) around natural heritage features identified in the project area is recommended. In order to protect vegetation adjacent to the working area from construction traffic and/or materials storage, tree protection fences/barriers should be utilized.
- To protect birds and comply with relevant federal and provincial legislation, all vegetation removal must be completed outside of the bird-breeding season. As such, vegetation clearing will not be undertaken from April 15th to August 15. Any vegetation removal during this breeding period will require a nest search by a qualified Avian Biologist prior to clearing the area.

- Create an Edge Management Plan (EMP) for the natural areas adjacent to the ROW. In the post-construction-operational phase of the project, vegetative buffers should be established to mitigate disturbance impacts to natural features and linkages. Vegetative buffers should be planted with native, non-invasive vegetation appropriate for the climate and local habitat conditions (e.g. soil type, soil moisture, light exposure, tolerance to urban stressors, etc.).
- Landscape vegetation should be comprised of native, salt-tolerant and non-invasive species.
- Replace trees that are accidentally damaged with similar size (or equivalent basal area) and species following construction.
- A water balance analysis should be conducted to ensure that construction related dewatering activities do not adversely affect the form and function of wetland and lowland forest communities (e.g. vegetation survivorship).
- Identify potential restoration areas (e.g. Core Areas and Linkages) in order to compensate for habitat lost in the ROW. Ecological restoration and enhancement is best achieved through the creation of a Restoration and Enhancement Plan (REP). The objective of the REP should be to increase biodiversity and ecological integrity of the natural heritage system. Some examples of how these objectives can be reached are through planting native vegetation, removal of non-native invasive, natural regeneration and installation of wildlife habitat structures. All mitigation, restoration and enhancement plans should be generated in consultation with the MNR and/or the HCA.

Potential Aquatic Impacts and Mitigation Considerations

The corridor associated with Alternatives 2 and 4 is expected to require a minimum of two crossings of Watercourse #5. It also appears that a potential re-alignment of Watercourse #5 may be required depending on the exact location of the proposed Fruitland Road.

In contrast, the corridor associated with Alternative 5 is expected to involve one crossing of Watercourse #5, and a crossing and/or re-alignment of the Tributary to Watercourse #5.

Potential aquatic impacts of these activities may include:

- Loss of riparian and in-stream vegetation at the crossing;
- Disturbance of existing substrates;
- Disturbance to flow conveyance during construction;
- Potential release of sediment into the watercourse;
- Potential loss of in-stream habitat features; and
- Disturbance of existing banks.

Depending on the requirement for re-alignment, particularly for Watercourse #5, there may be a need to incorporate the use of natural channel design into the planned works to assist in compensating for the loss of fish habitat.

Mitigation considerations for potential in-water activities associated with the Fruitland Road alternatives, including potential new crossings and/or re-alignments of Watercourse #5 and Tributary to Watercourse #5 may include, but are not limited to, the following:

- In-water works should be conducted during the appropriate timing window (e.g., outside of the warm water March 15 – June 30 spring period) and not during high flow conditions;

- Existing flows should be maintained downstream of the work area at all times during construction via an appropriate method such as a dam and pump bypass method or diversion;

- All construction materials and equipment used for the purposes of site preparation and project completion should be operated and stored in a manner that prevents any deleterious substances from entering the watercourses;

- Any stockpiled construction materials should be stored away from the watercourses;

- Vehicular and equipment refueling and maintenance should be conducted away from the watercourses;

- Implementation of sediment and erosion control measures should occur prior to the commencement of construction, and maintained and upgraded as necessary during the construction phase to prevent entry of sediment into the water (e.g., silt fencing, traps, filter bags, check dams etc);

- All disturbed surfaces should be stabilized as soon as possible after construction;

- All sediment and erosion control measures should be left in place and maintained until vegetative cover is established and/or until the construction site has stabilized.

There is potential that a *Fisheries Act* Authorization would be required for potential modifications to Watercourse #5, in addition to approval under the *Conservation Authorities Act*. Permit and approval requirements would need to be confirmed through agency consultation once more information/details are known regarding potential watercourse works.

6. SUMMARY

An assessment of natural heritage features was conducted for lands bounded by Fruitland Road to the west, Glover Road to the east, Highway 8 to the south, and Barton Street to the north, in the City of Hamilton. This assessment was conducted to assist City of Hamilton staff with preparation of the Fruitland-Winona Secondary Plan, and to provide natural heritage information as input for the Class EA that is underway for improvements to Fruitland Road between Highway 8 and Barton Street. Using a variety of survey methods, including an investigation of vegetation, Ecological Land Classification, amphibians, wildlife, fisheries, and species at risk, recommendations were provided with respect to constraints to development and areas to be protected, with consideration for the overall landscape ecology. In addition, primary road corridors associated with Fruitland Road Class EA alternatives were discussed in the context of potential impacts and mitigation considerations for the protection of natural features.

Table B.2. Bird Species Observed During Fieldwork in the Fruitland Road Class EA Study Area

Family	Scientific Name	Common Name	G Rank	S Rank	SARA[3] or ESA[4]	Hamilton Wentworth Conservation Priority Species	Typical primary breeding habitat
GAVIIDAE	*Gavia immer*	Common Loon	G5	S4B, SZN	-	**Yes**	Lakes/ponds/rivers
ANATIDAE	*Branta canadensis*	Canada Goose	G5	S5B, SZN	-	-	Variety of habitats near wetlands
RALLIDAE		Unknown Rail sp			-	-	
CHARADRIIDAE	*Charadrius vociferus*	Killdeer	G5	S5B, SZN	-	-	Agriculture
LARIDAE	*Larus argentatus*	Herring Gull	G5	S5B, SZN	-	-	Islands
	Larus delawarensis	Ring-billed Gull	G5	S5B, SZN	-	-	Islands
SCOLOPACIDAE	*Scolopax minor*	American Woodcock	G5	S5B, SZN	-	**Yes**	Early successional
ACCIPITRIDAE	*Buteo jamaicensis*	Red-tailed Hawk	G5	S5B, SZN	-	-	Agricultural
COLUMBIDAE	*Columba livia*	Rock Dove	G5	SE	-	-	Urban
	Zenaida macroura	Mourning Dove	G5	S5B, SZN	-	-	Early successional
APODIDAE	*Chaetura pelagica*	Chimney Swift	G5	S5B, SZN	**THR[3,4]**	-	Urban
PICIDAE	*Colaptes auratus*	Northern Flicker	G5	S5B, SZN	-	-	Mixed woodlands
	Picoides pubescens	Downy Woodpecker	G5	S5	-	-	Deciduous woodlands
ALAUDINIDAE	*Eremophila alpestris*	Horned Lark	G5	S5B, SZN	-	**Yes**	Agricultural
BOMBYCILLIDAE	*Bombycilla cedrorum*	Cedar Waxwing	G5	S5B, SZN	-	-	Open Woodlands
CARDINALIDAE	*Cardinalis cardinalis*	Northern Cardinal	G5	S5	-	-	Woodlands
	Passerina cyanea	Indigo Bunting	G5	S5B, SZN	-	-	Open Woodlands
CORVIDAE	*Corvus brachyrhynchos*	American Crow	G5	S5B, SZN	-	-	Woodlands
	Cyanocitta cristata	Blue Jay	G5	S5	-	-	Woodlands
EMBERIZIDAE	*Melospiza georgiana*	Swamp Sparrow	G5	S5B, SZN	-	**Yes**	Marsh
	Melospiza melodia	Song Sparrow	G5	S5B, SZN	-	-	Early successional
	Passerculus sandwichensis	Savannah Sparrow	G5	S5B, SZN	-	**Yes**	Agricultural

	Spizella pallida	Clay-coloured Sparrow	G5	S4B, SZN	-	**Yes**	Early successional
	Spizella passerina	Chipping Sparrow	G5	S5B, SZN	-	-	Coniferous woodlands
	Spizella pusilla	Field Sparrow	G5	S5B, SZN	-	**Yes**	Early successional
	Zonotrichia albicollis	White-throated Sparrow	G5	S5B, SZN	-	**Yes**	Early successional
FRIGILLIDAE	*Carduelis tristis*	American Goldfinch	G5	S5B, SZN	-	**Yes**	Early successional
	Carpodacus mexicanus	House Finch	G5	SE	-	-	Urban
HIRUNDINIDAE	*Hirundo rustica*	Barn Swallow	G5	S5B, SZN	-	**Yes**	Agricultural
	Stelgidopteryx serripennis	Northern Rough-winged Swallow	G5	S5B, SZN	-	**Yes**	Lakes/ponds/rivers
	Tachycineta bicolor	Tree Swallow	G5	S5B, SZN	-	-	Treed/shrubby swamp
ICTERIDAE	*Agelaius phoeniceus*	Red-winged Blackbird	G5	S5B, SZN	-	-	Marsh
	Dolichonyx oryzivorus	Bobolink	G5	S4B, SZN	-	**Yes**	Agricultural
	Icterus galbula	Baltimore Oriole	G5	S5B, SZN	-	-	Deciduous woodlands
	Icterus spurius	Orchard Oriole	G5	SZB, SZN	-	**Yes**	Open woodlands
	Quiscalus quiscula	Common Grackle	G5	S5B, SZN	-	-	Woodlands
	Molothrus ater	Brown-headed Cowbird	G5	S5B, SZN	-	-	Agricultural
	Sturnella magna	Eastern Meadowlark	G5	S5B, SZN	-	**Yes**	Agricultural
MIMIDAE	*Dumetella carolinensis*	Gray Catbird	G5	S5B, SZN	-	-	Early successional
	Mimus polyglottos	Northern Mockingbird	G5	S4B, SZN	-	**Yes**	Early successional
PARIDAE	*Poecile atricapillus*	Black-capped Chickadee	G5	S5	-	**Yes**	Mixed woodlands
PARULIDAE	*Dendroica coronata*	Yellow-rumped Warbler	G5	S5B, SZN	-	**Yes**	Coniferous woodlands
	Dendroica petechia	Yellow Warbler	G5	S5B, SZN	-	-	Early successional
	Dendroica striata	Blackpoll Warbler	G5	S4B, SZN	-	-	Coniferous woodlands/Treeline
	Geothlypis trichas	Common Yellowthroat	G5	S5B, SZN	-	-	Marsh
	Oporornis philadelphia	Mourning Warbler	G5	S5B, SZN	-	**Yes**	Open woodlands

	Seiurus aurocapillus	Ovenbird	G5	S5B, SZN	-	**Yes**	Deciduous woodlands
	Seiurus noveboracensis	Northern Waterthrush	G5	S5B, SZN	-	-	Treed /shrubby swamp
	Setophaga ruticilla	American Redstart	G5	S5B, SZN	-	**Yes**	Deciduous woodlands
PASSERIDAE	*Passer domesticus*	House Sparrow	G5	SE	-	-	Urban
STURNIDAE	*Sturnus vulgaris*	European Starling	G5	SE	-	-	Urban
SYLVIIDAE	*Polioptila caerulea*	Blue-gray Gnatcatcher	G5	S4B, SZN	-	**Yes**	Deciduous woodlands
THRAUPIDAE	*Piranga olivacea*	Scarlet Tanager	G5	S5B, SZN	-	-	Deciduous woodlands
TROGLODYTIDAE	*Troglodytes aedon*	House Wren	G5	S5B, SZN	-	-	Early successional
TURDIDAE	*Turdus migratorius*	American Robin	G5	S5B, SZN	-	-	Urban
TYRANNIDAE	*Empidonax traillii*	Willow Flycatcher	G5	S5B, SZN	-	-	Shrubby swamp
	Tyrannus tyrannus	Eastern Kingbird	G5	S5B, SZN	-	**Yes**	Early successional
VIREONIDAE	*Vireo gilvus*	Warbling Vireo	G5	S5B, SZN	-	-	Open woodlands
	Vireo olivaceus	Red-eyed Vireo	G5	S5B, SZN	-	-	Deciduous woodlands

Table B.3. Mammal Species Potentially Occurring in the Fruitland Road Class EA Study Area (Dobbyn 1994).

Scientific Name	Common Name	Provincial Status (COSSARO)	National Status (COSEWIC)	MNR Status (SRank)	Observed During Fieldwork*
Myotis lucifuga	Little Brown Bat	NAR	NAR	S5	-
Eptesicus fuscus	Big Brown Bat	NAR	NAR	S5	-
Canis latrans	Coyote	NAR	NAR	S5	-
Vulpes vulpes	Red Fox	NAR	NAR	S5	-

Appendix D

Fruitland Road Class EA Field Work Tables

Table D.1 – Description of ELC Communities

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
DECW	Deciduous woodlot	-	This small woodlot consists of common buckthorn, red ash, domestic apple, Norway maple, hawthorn and gray dogwood.	This community is present alongside the hawthorn deciduous thicket and orchard in the eastern portion of the study area.
FODM7-2	Fresh-Moist Green Ash Hardwood-Lowland Deciduous Forest	Silty Clay; 3-4 moisture regime	This mid-aged community's canopy and sub-canopy is dominated by red ash with rare occurrences of shagbark hickory, red oak and maple. Understory consists of bur oak, buckthorn and red ash. Jack-in-the-pulpit, garlic mustard, enchanter's nightshade and spotted jewelweed are all present in groundcover.	This community is located along parts of the riparian corridor of Watercourse #6.
FODM9-6	Fresh-Moist Oak – Hardwood Deciduous Forest	Silty clay loam; 5 moisture regime	The canopy of this naturally treed community's canopy is characterized by mature bur oak, white oak, red oak and shagbark hickory with a sub-canopy of red ask, trembling aspen and white elm. The understory is dominated by buckthorn with gray dogwood and pasture rose found occasionally. The ground layer contains herbaceous species such as Jack-in-the-pulpit.	This remnant mature forest community is a transition area between residential properties and agricultural fields in the northeastern section of the study area.. A small green ash lowland forest (FODM7-2) was documented just east of this community.
MEMM4 Inclusions:	Fresh-Moist Mixed Meadow Inclusions:	Clay; 6 moisture regime	The sparse canopy in this young community contains crabapple. The dominant understory consists of hawthorn, gray dogwood and	This large open community dominates large portions of the northwestern section of the study area.

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
1.MAMM1-15 2.MAMM2-5	1. Bulrush Gaminoid Mineral Meadow Marsh 2. Purple loosestrife Forb Mineral Meadow Marsh		rose species, while the ground layer is characterized by blue grass, barn grass, red top grass, wild carrot, red clover and timothy. Inclusion #1. This small bulrush meadow marsh has a dominant presence of hardstem bulrush. Other species present include purple loosestrife, barnyard grass, water plantain, curly dock, goldenrod and common cattail. Inclusion #2. Purple loosestrife dominates the area with common occurrences of common cattail. Other species include common reed, black bulrush, wild carrot, red osier dogwood.	Inclusion #1. Evidence of standing water in the bulrush meadow marsh was present during September field work. Inclusion #2. This small purple loosestrife meadow marsh has a high presence of alien species No standing water was evident within the marsh in September.
OAGM1	Annual Row Crop	-	Cropland (e.g. soy, lettuce, etc.)	Active agricultural areas.
SAGM2	Orchard	-	Orchard crop (e.g. apple, pear, etc.)	Active agricultural areas.
SWDM2-2	Green Ash Mineral Deciduous Swamp	Clay; 6 moisture regime	This natural wetland system's canopy is dominated by red ash with occasional presence of bur oak, white willow and Manitoba maple. The understory contains buckthorn, red ash and gray dogwood. The ground layer includes buckthorn, spotted jewelweed and common strawberry.	The green ash deciduous swamp vegetation type is the most common riparian vegetation communities in the study area.

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
			1. This is a willow swamp riparian community which occupies the banks of watercourse #6 and 7.	
TAGM1	Coniferous Plantation	-	This cultural area is located in the north-west portion of the site. Typical stands include Scotts pine, red pine, white pine, white spruce, etc.	Note: Plantation areas have been removed (labeled PR on the ELC figure). A small plantation area remains.
TAGM3	Deciduous Plantation	-	This cultural area is located in the north-west portion of the site. Typical stands include maple and oak species.	Note: Plantation areas have been removed (labeled PR on the ELC figure). A small plantation area remains.
THDM2-11	Hawthorn (Dogwood/Buckthorn) Deciduous Shrub Thicket	Silty clay loam; 1 moisture regime	This young thicket consists of an canopy of a variety of deciduous species including crabapple, red ash and bur oak. Buckthorn, gray dogwood and hawthorn species dominate the understory. Wild carrot, red clover, timothy and buckthorn are common groundcover.	Extensive gaps were found within the canopy. This small thicket is a transition area between lowland deciduous forest and graminoid mineral meadow marsh.
Other ELC Codes				
CEM	Cemetery	-	-	Graveyard and associated buildings.
CVR_3	Single Family Residential	-	-	Large single family dwellings lots that occasionally have small agricultural cropland/vineland areas.
CVR_4	Rural Property	-	-	Small single family dwellings lots

ELC Code	Classification	Soils/Hydrology	Vegetation	Comments
H	Hedgerow	-	Mainly consist of deciduous trees and shrubs. High composition of non-native species (e.g. crab apple, buckthorn)	Hedgerows that divide agricultural fields.
PR	Plantation Removed	-	-	Denotes harvested area. Land is currently denude of vegetation.

Table D.2. Plant Species Observed within the Fruitland Road Class EA Study Area

Scientific Name	Common Names	Coefficient Conservation	Global Rank	COSEWIC	COSSARO	SRank	Introduced
Abutilon theophrasti	Velvetleaf	0	G?	-	-	SE5	I

STONEY CREEK URBAN BOUNDARY EXPANSION AREA

(SCUBE) WEST SUBWATERSHED STUDY

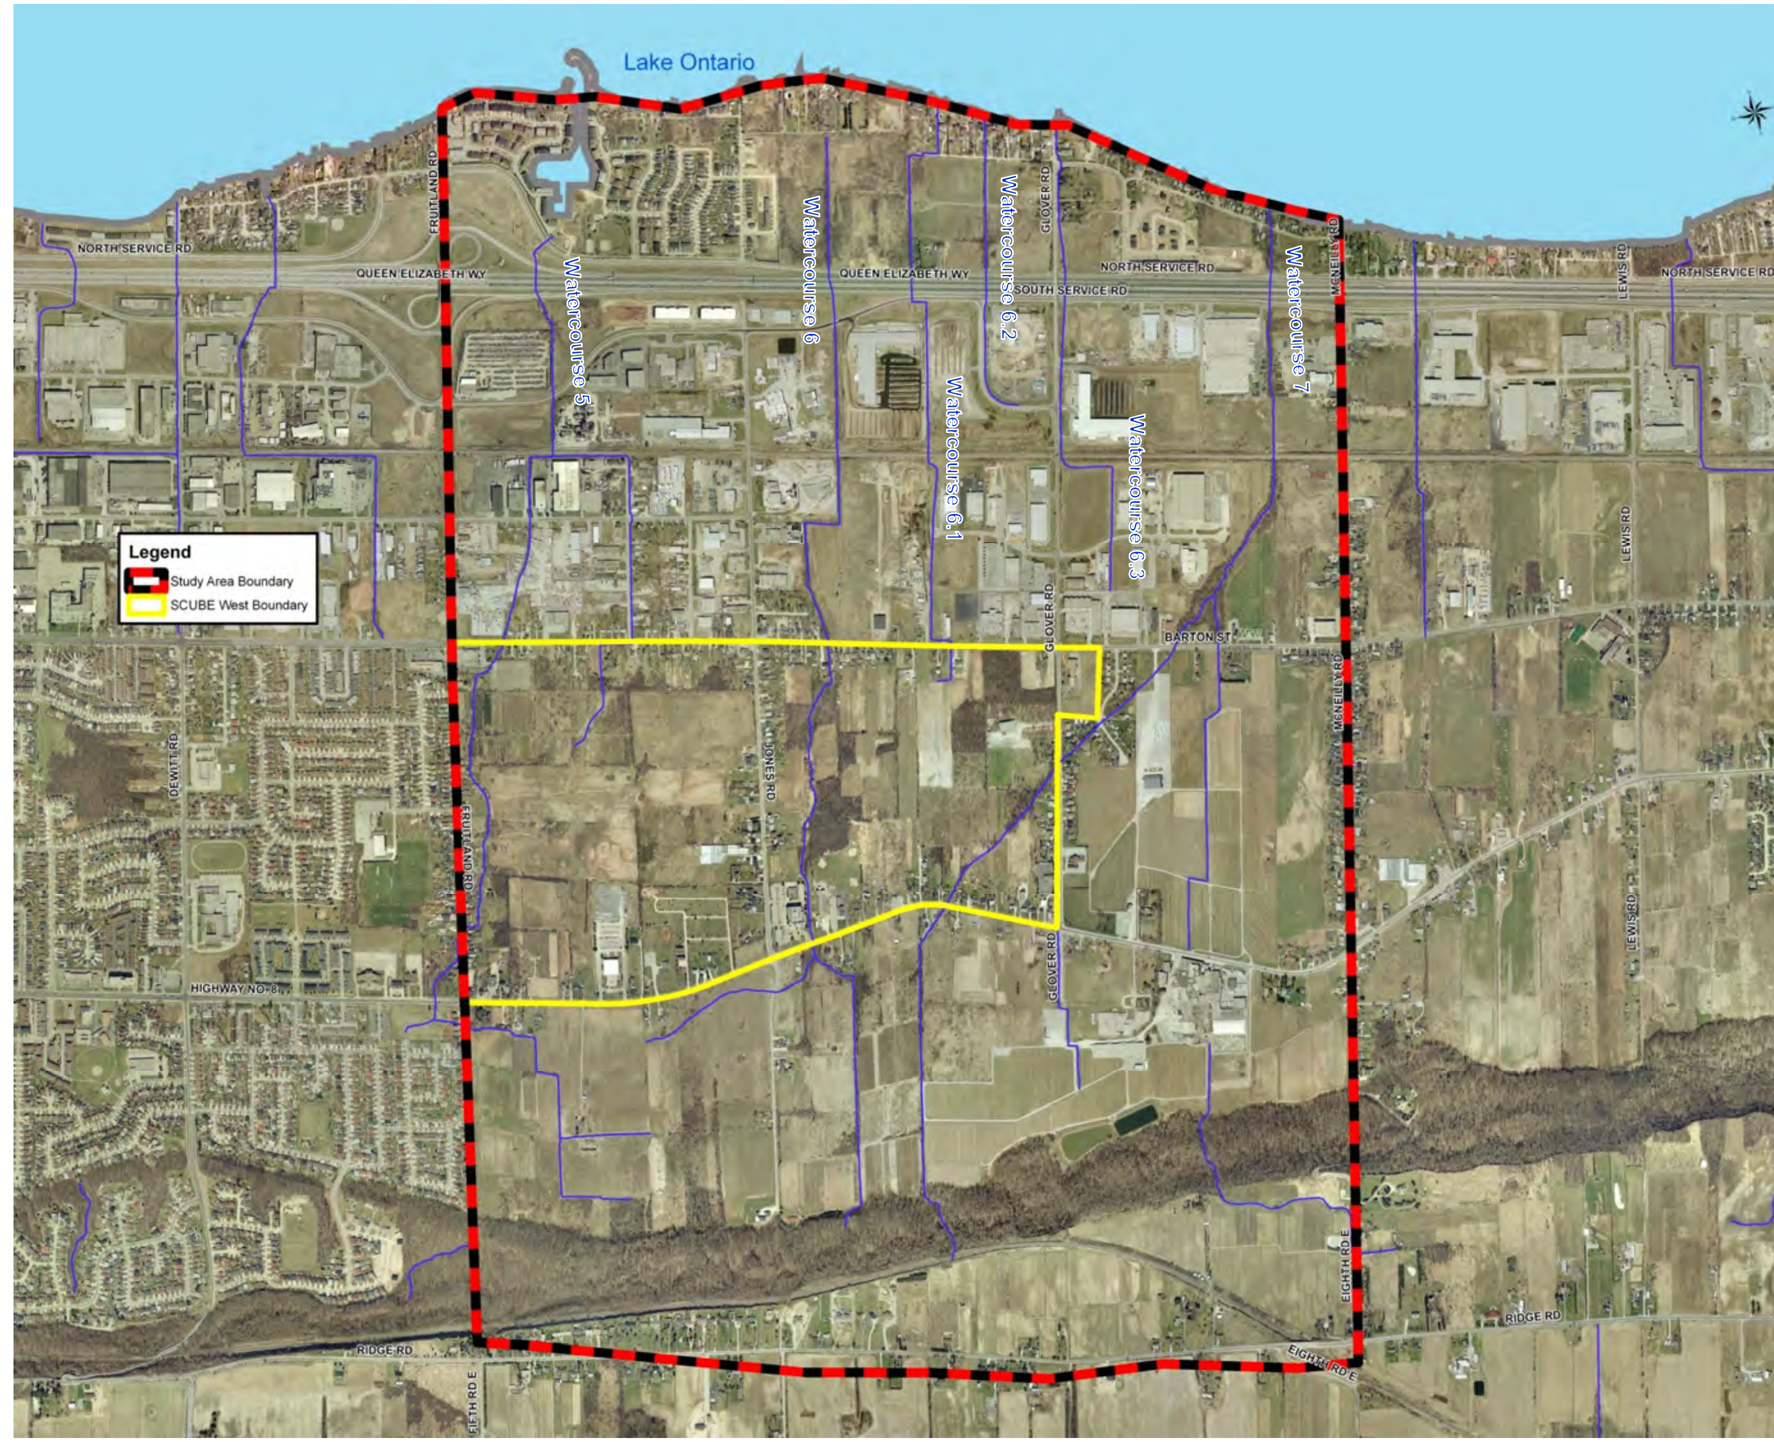
STONEY CREEK URBAN BOUNDARY EXPANSION WEST

Subwatershed Study

Public Information Centre No.# 1
Date: June 24, 2010

Study Area

The Subwatershed Study Area consists of the drainage boundaries of the watercourses which drain the proposed future development areas, namely Watercourses 5, 6, 6.1, 6.2, 6.3 and 7.



Hamilton
Public Works

Environment and Sustainable Infrastructure Division
Public Works, City of Hamilton

Aquafor Beech Limited

Study Overview

Objectives:

Key objectives of the Subwatershed Study will be to ensure that future development :

- Occurs outside of the Regulatory Floodplain;
- Does not result in unacceptable increases in downstream flooding;
- Protects groundwater quantity and quality as future development occurs;
- Maintains and enhances surface water quality;
- Protect components of the Natural Heritage System;
- Implements a preferred stormwater management plan in compliance with the Class EA.

PHASES OF THE STUDY

Phase 1: Establish Environmental Conditions

Tasks:

- Define existing environmental conditions;
- Identify and evaluate natural features and functions of the study area and their potential interrelationship with other natural features; and
- Develop constraints mapping to identify developable lands, non-developable lands, and lands requiring environmental mitigation before development can occur.

Phase 2: Complete Impact Assessment and Develop Recommended Subwatershed Plan

Tasks:

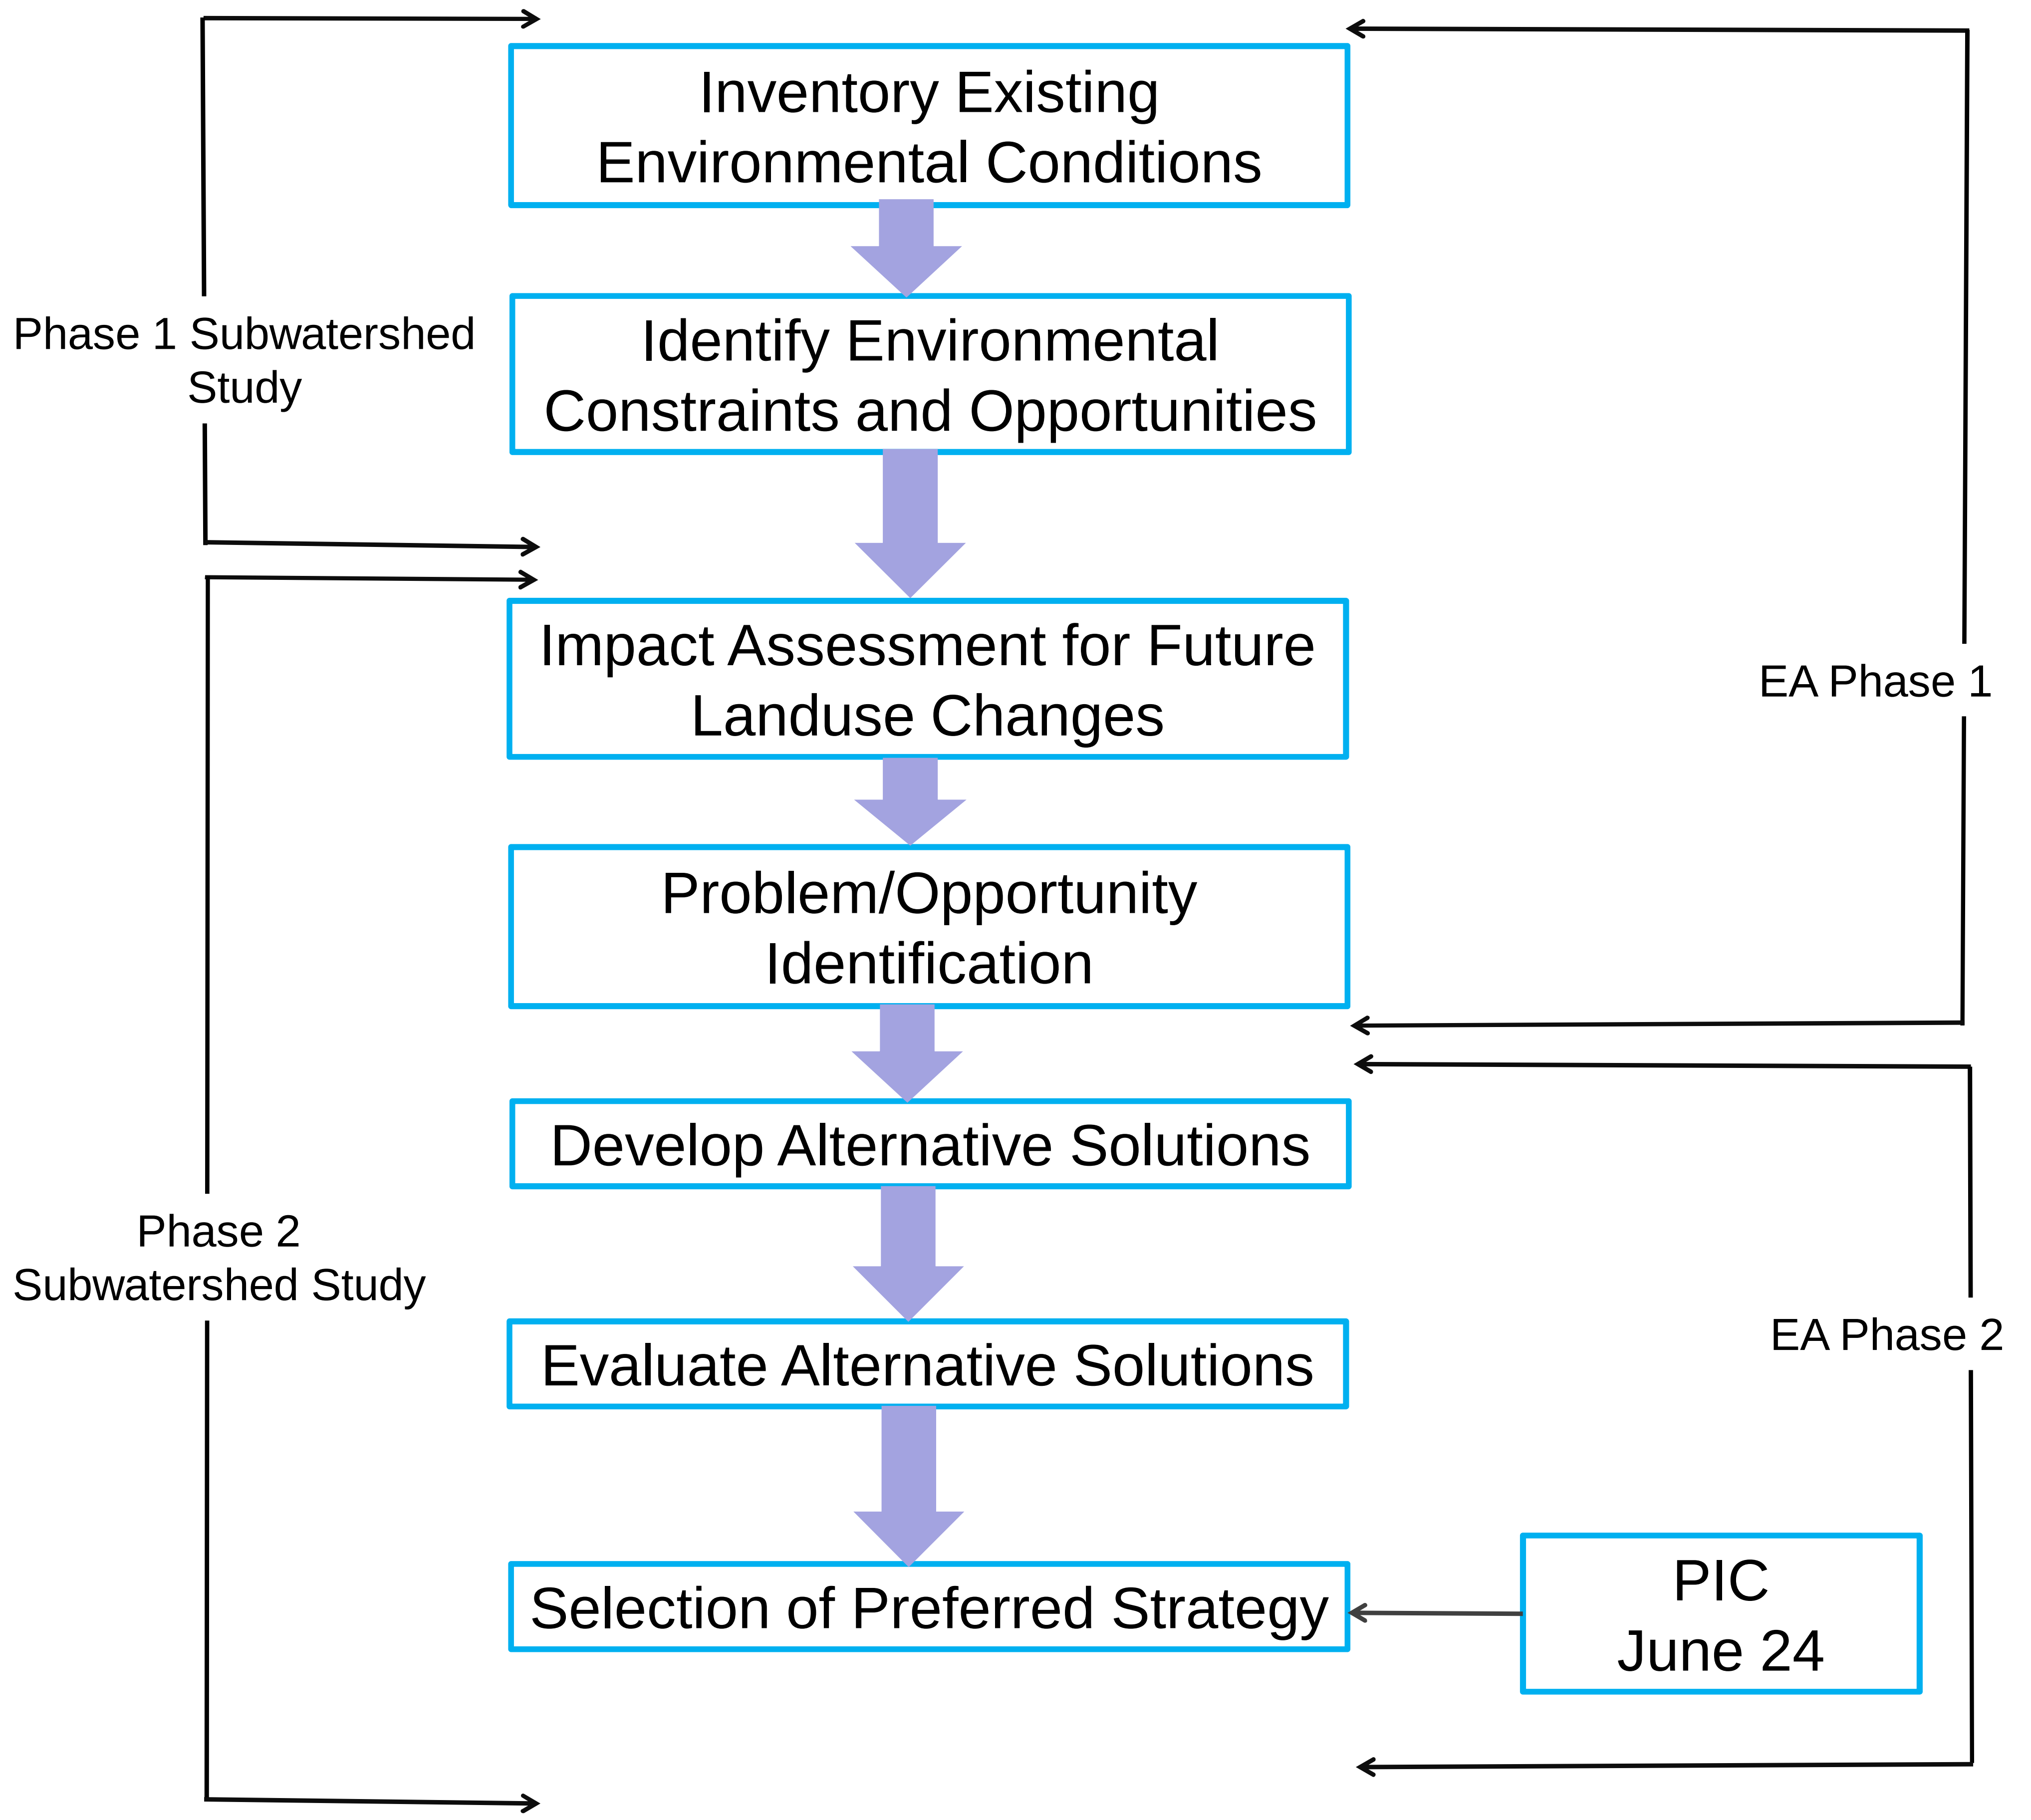
- Fill gaps identified in Phase 1
- Complete floodplain mapping
- Undertake impact assessment
- Develop preferred stormwater management plan in compliance with Class EA
- Finalize natural heritage system

Phase 3: Implementation

- Develop a plan to ensure proposed works are undertaken.

ENVIRONMENTAL ASSESSMENT PROCESS

The Study is being conducted as a Master Plan and is intended to satisfy Phases 1 and 2 of the Municipal Engineers Association (MEA) Municipal Class Environment Assessment Act (Class EA) process. This will involve a process of problem / opportunity identification, evaluation of alternative solutions, and selection of a preferred solution. Stakeholder consultation is an important part of the EA process, and a key component of the study.



RELATED PROJECTS

The City of Hamilton is in the process of preparing the Fruitland - Winona Secondary Plan in anticipation of future urban development within the Stoney Creek Urban Boundary Expansion (SCUBE). This study, termed the SCUBE West Subwatershed Study, is one of two Subwatershed studies undertaken in support of the Fruitland - Winona Secondary Plan. In addition to these two studies several other studies have been completed , or are ongoing. These include:

Draft Natural Heritage Assessment

Ø A study to assess the natural heritage features for the lands between Fruitland Road, Glover Road, Barton Street and Highway 8 was initiated in 2009.

SCUBE Area Transportation Master Plan (Phase 1 & 2) Study Report

Ø The objective of this study was to assess transportation needs to accommodate planned growth in the Stoney Creek Urban Boundary Expansion (SCUBE) area by 2021. The study was completed in 2008.

Watercourses 5 and 6 Class Environmental Assessment Study

Ø This study, completed in 2007, defined each watercourse in terms of technical environmental components such as hydraulic capacities, fluvial geomorphology, aquatic and terrestrial resources, and socio-economic conditions.

Watercourse No. 7 Creek System Improvements

Ø The primary purpose of this study was to determine a preferred watercourse system improvement solution for Watercourse No. 7, between Barton Street and Lake Ontario, to address flooding, erosion, terrestrial and aquatic habitat issues. The study was completed in 2003.

Hydraulic Study (ongoing)

Ø The study is conducting stormwater hydraulic modeling and analysis for Watercourses 5, 6, 6.1, 6.2 and 6.3

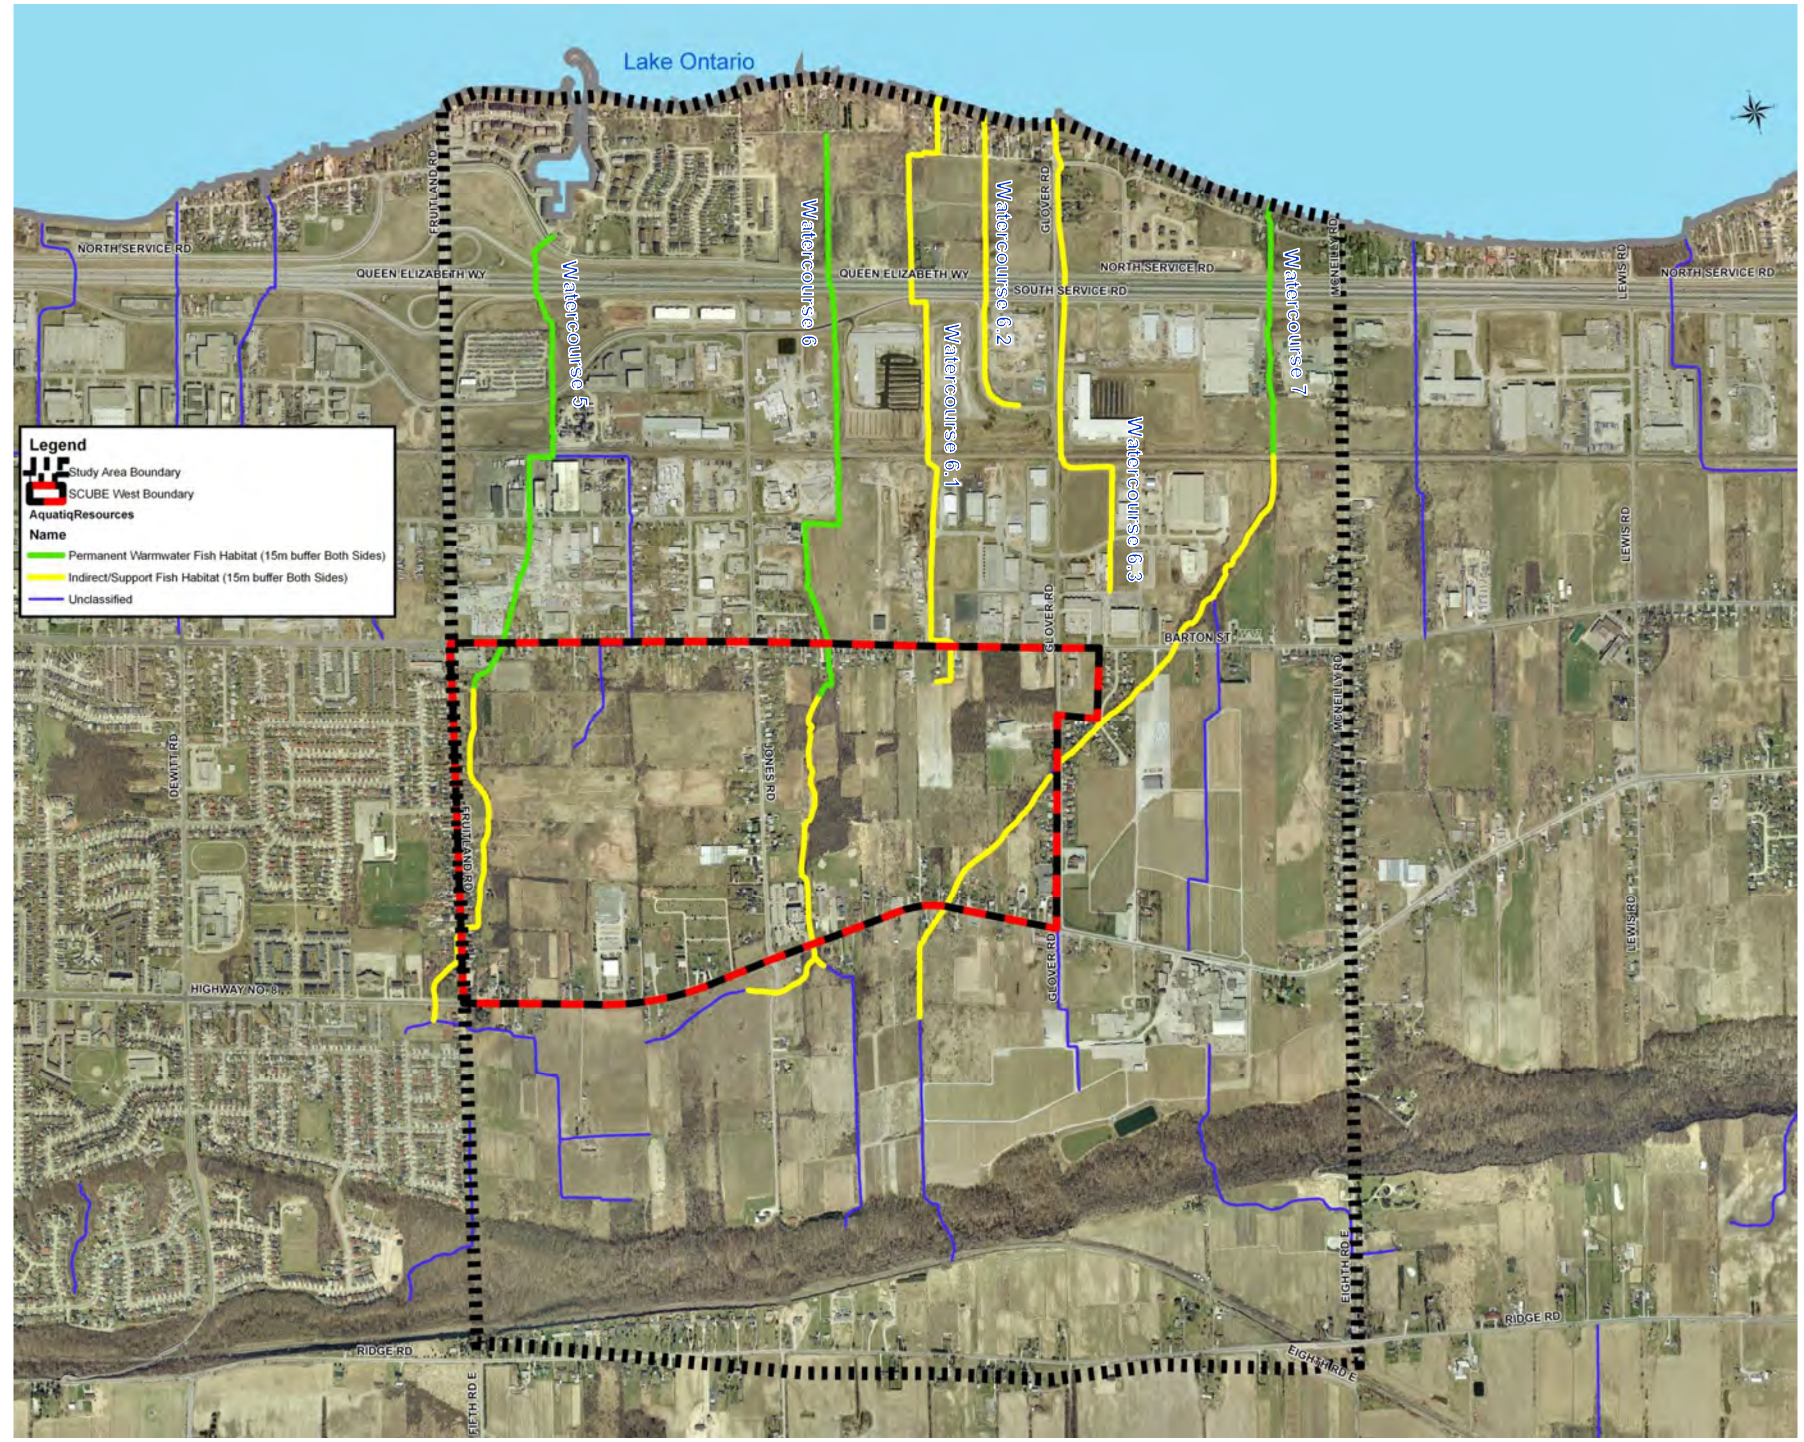
Hydrogeology Study (ongoing)

Ø The study is undertaking detailed fieldwork and analyses for SCUBE West area to determine the key characteristics of the bedrock and overburden systems and their function in the control of groundwater movement.

Aquatic Resources

Aquatic Resources

- Most headwaters are intermittent, as well as a number of the smaller drainage features and tributaries of watercourses 5 and 6
- Watercourses 5, 6 and 7 are permanent streams, watercourses 6.1, 6.2 and 6.3 are intermittent.
- The portions of Watercourses 5, 6 and 7 within and downstream of the developable land areas are considered to support warmwater fish communities, however they have a number of limitations, including:
  - Lack of baseflow
  - Instream barriers, particularly in the lower reaches
  - Lack of riparian cover
- The remaining features in the study area are considered to provide indirect/support fish habitat.
- Generally the streams are considered to support tolerant warmwater fish species, which may include the following: creek chub, white sucker, bluntnose minnow, fathead minnow, blacknose dace.

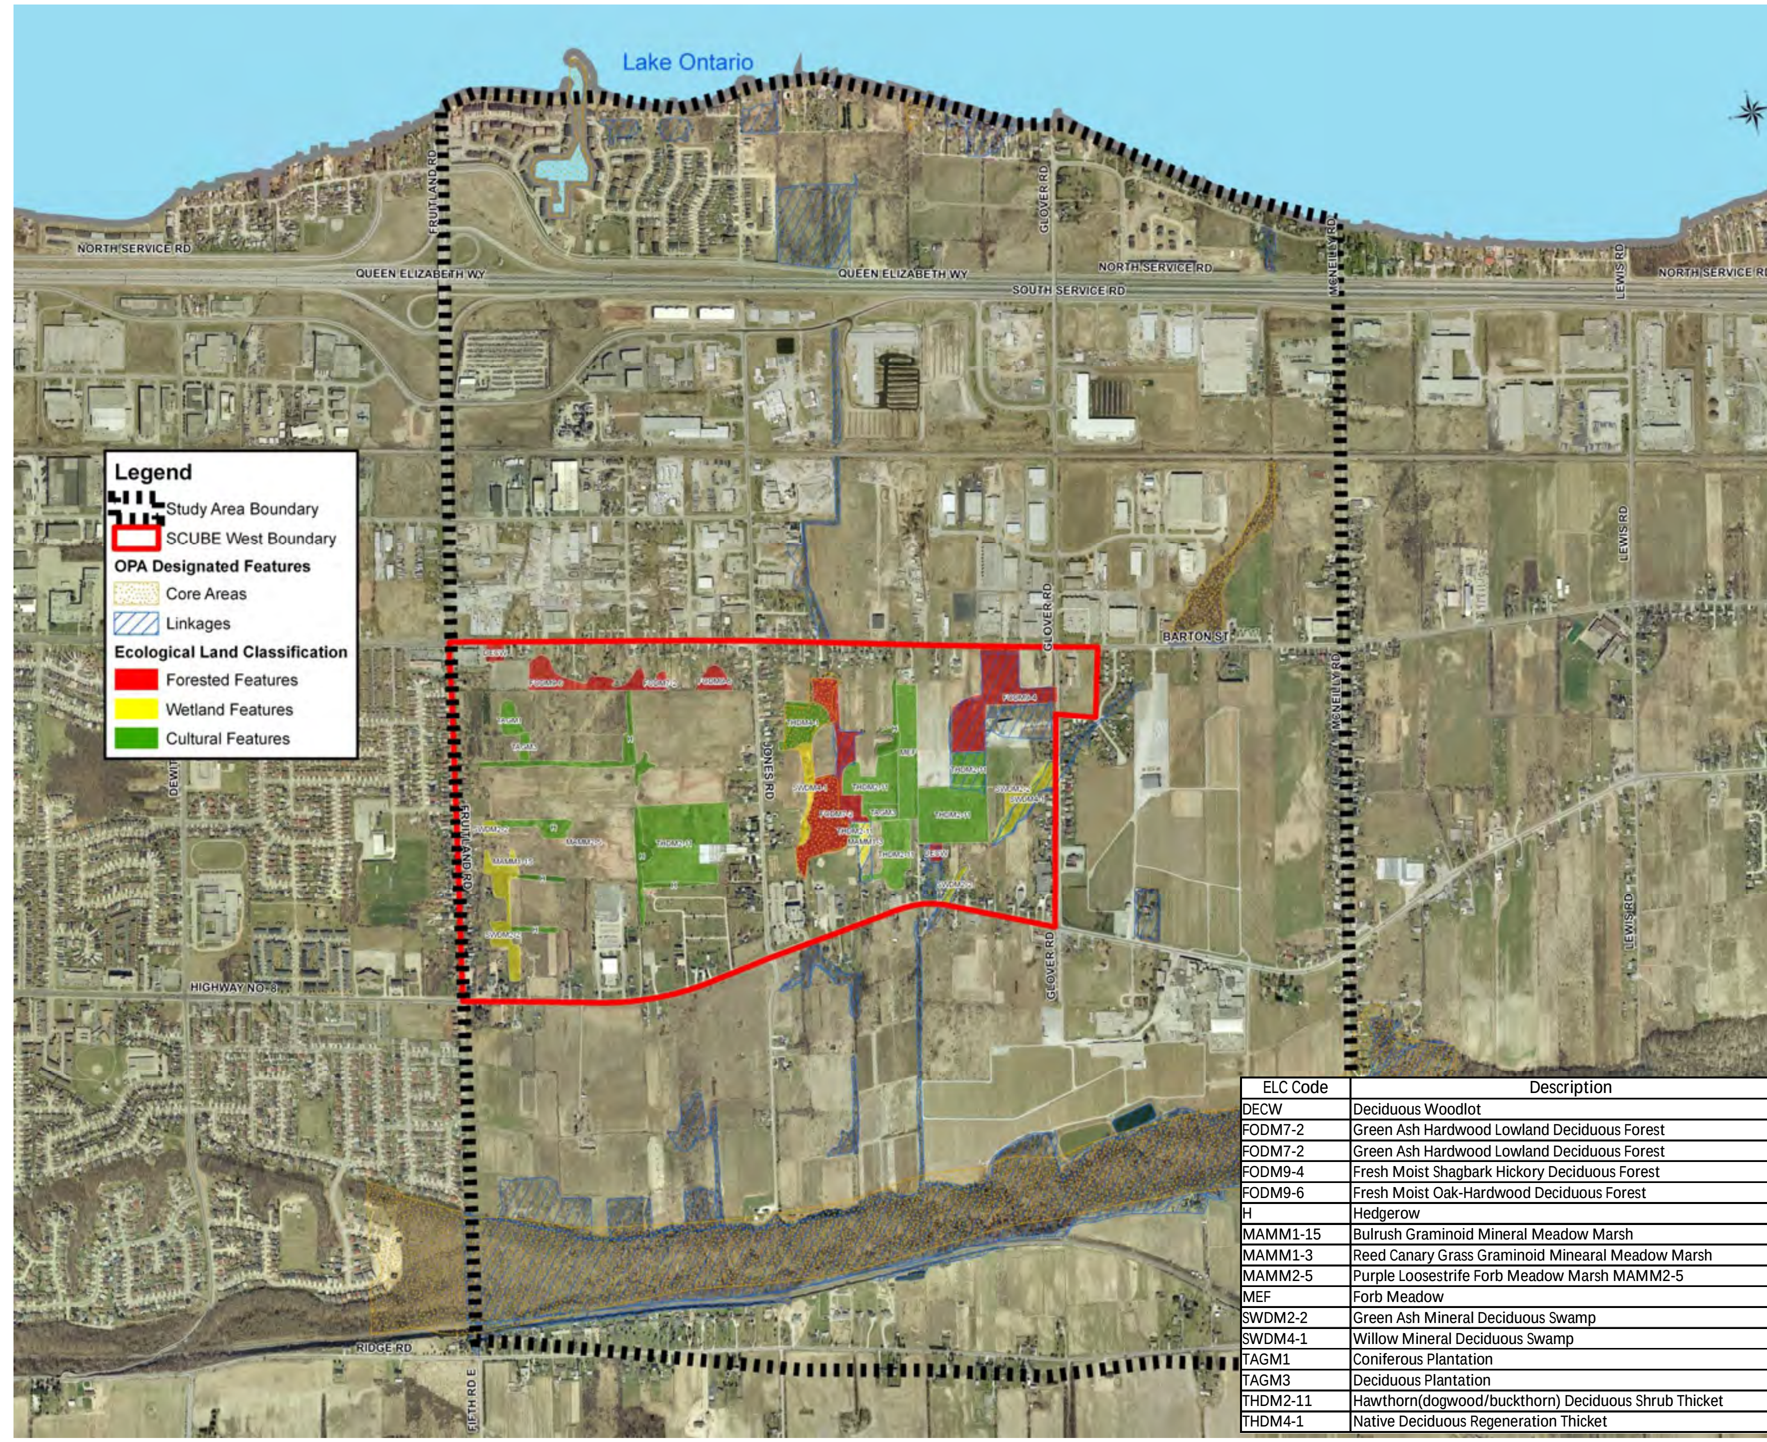


Terrestrial Resources

Terrestrial Resources

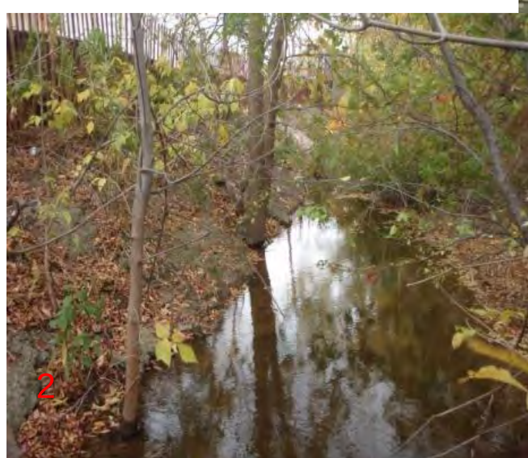
Much of the study area is currently or formerly agriculture including orchards and vineyards and the majority of the remnant natural areas are cultural forests, meadows and mixed meadows/wetlands. An Ecological Land Classification was completed of the Study Area through various previous studies with the following findings:

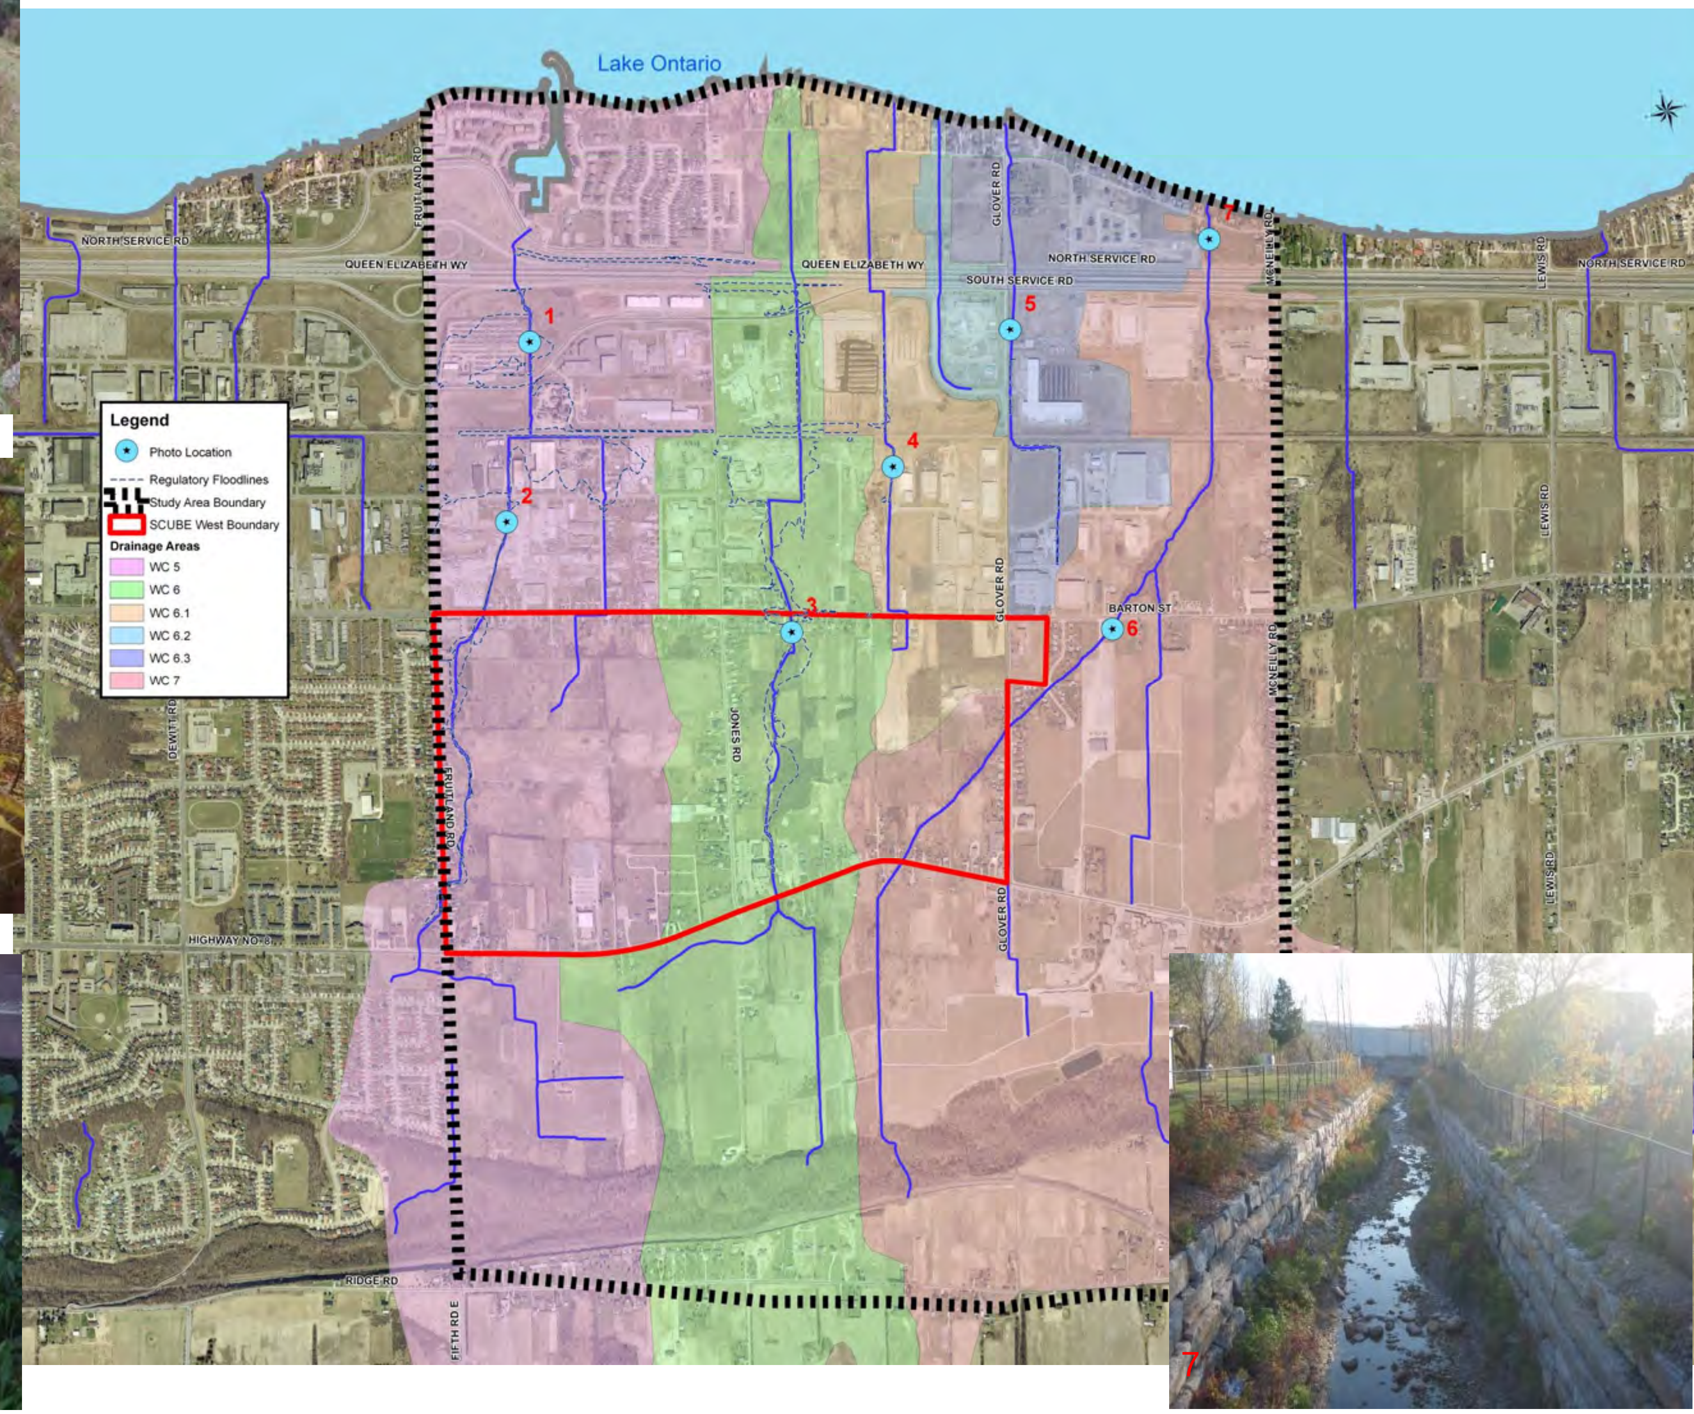
- Several Core and Linkage areas are designated in the OPA
- 11 separate ELC communities were identified, mostly cultural in nature
- 194 vegetation species, 41% of which are considered non-native
- No species at risk vegetation is present
- 6 of 22 reported mammals were observed, none of which is a species at risk
- 58 bird species were recorded including some which are considered area sensitive
- 5 amphibians were found, all of which are commonly found in Ontario
- While species range information suggests that 5 birds and 7 reptiles, which are species at risk, could occur in this area, neither the species or their habitats have been identified.



Stream Morphology and Surface Water Resources

Public Information Centre No.# 1
Date: June 24, 2010





Stream Morphology and Surface Water Resources

Surface Drainage

- The Catchment Areas of 3 Watercourses: 5, 6 and 7; drain the study area. A diversion carries flows from W.C. 6 to W.C. 5 at the QEW.
- All features have been substantially modified by agricultural, urbanization and transportation corridor-related purposes and currently function primarily as flow conveyance systems
- Most features are straightened, lack riparian cover and have wide shallow floodplains
- An updated hydrologic model and updated floodplain mapping is being completed for the study area
- Regulatory floodlines represent limits to development
- Several inconsistencies in floodplain mapping are being refined:
  - Where apparent spill zones are indicated
  - Where inconsistencies between stream channel, topographic mapping and floodlines occur

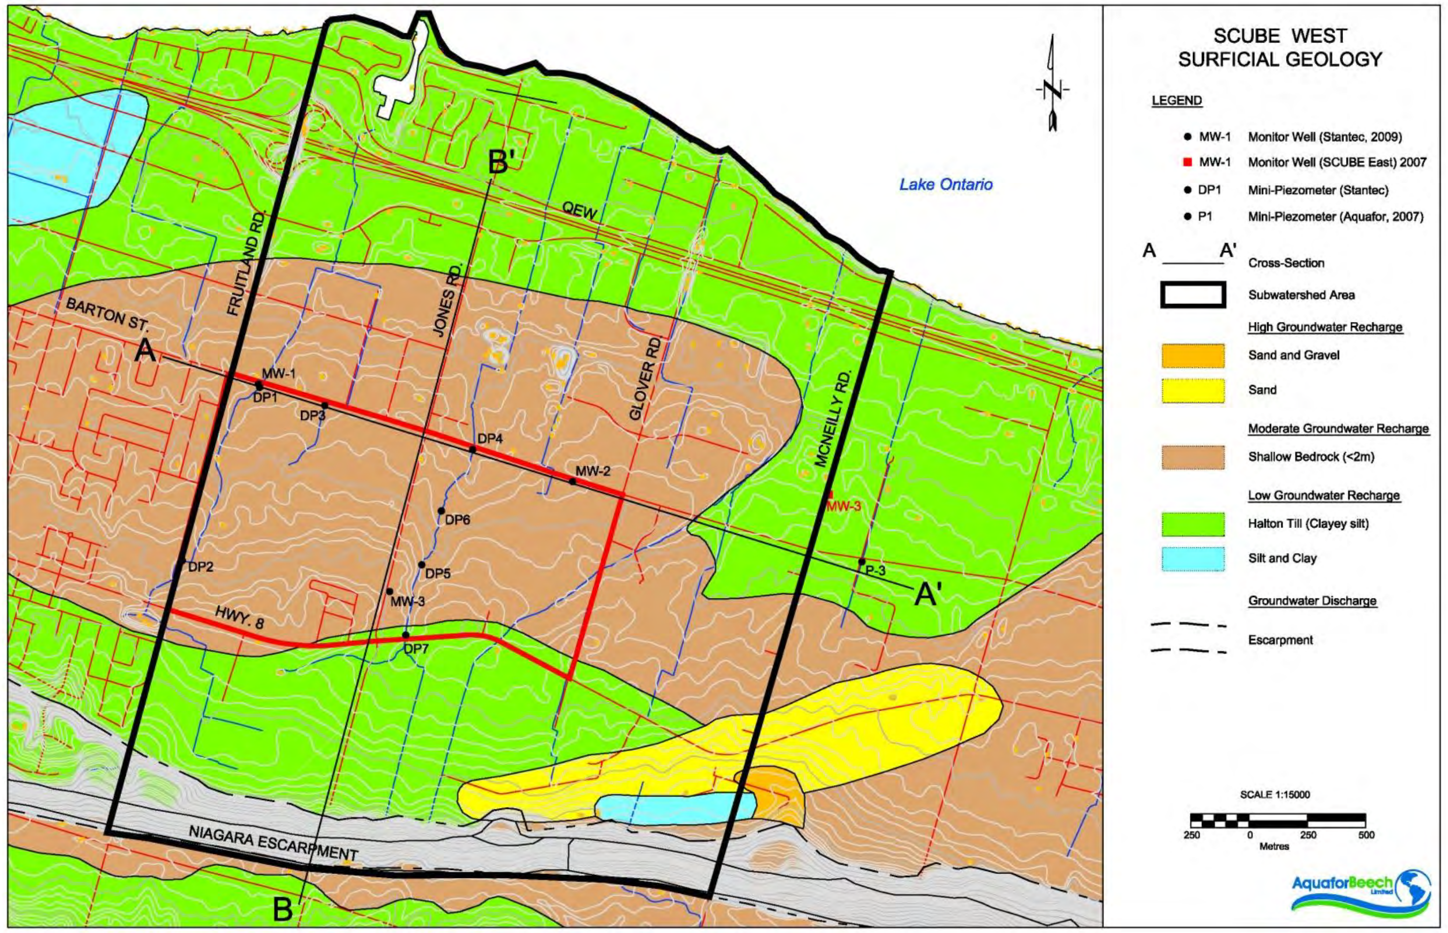
Water Quality

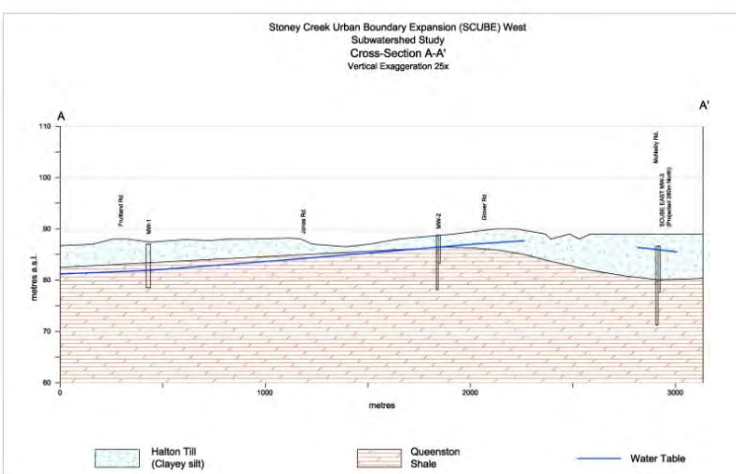
- Very little background information is available, but the watercourses can be generally characterized as nutrient rich systems with Total Phosphorus, Total Suspended Solids and E. coli (bacteria) levels exceeding standards/guidelines
- Trace metals, such as copper, lead and zinc are generally below guidelines with some exceedences during wet events as a result of the existing transportation infrastructure

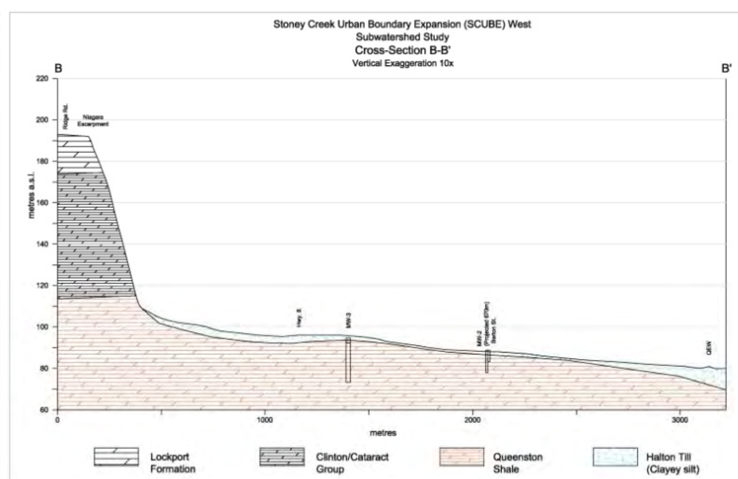
Stream Morphology

- The drainage systems are typically low gradient features in clayey silt surficial material typical of the Halton till
- Generally the watercourses are stable and have been enlarged for drainage conveyance purposes and thus are not generally susceptible to erosion
- In some areas, incisement/entrenchment of the channel has occurred leading to localized erosion and conditions where the channel is disconnected from its floodplain

Groundwater Resources







Hydrogeology is the study of water movement below the ground surface and is typically dependant on surficial and bedrock geology

Analysis

Water well records, borehole records, geology, and soils maps were reviewed to characterize the groundwater system within the study area.

Findings

- A significant portion of the subwatershed is characterized by shallow, fractured bedrock including the study area
- Within the study area, shallow fractured bedrock is considered to have moderate recharge potential in the order of 100 – 150 mm/yr
- Streamflow is generated largely by storm events although some baseflows may be generated along the base of the Escarpment
- Watercourses are near-intermittent
- Opportunities for infiltration of Stormwater are considered somwhat limited within the developable land areas

Opportunities & Constraints

Within the subwatershed area and the future development area, there are a number of environmental protection and enhancement measures to be considered. These measures represent constraints to development, as well as opportunities to enhance the natural environment, as outlined below.

CONSTRAINTS

Preservation Areas (No Development)

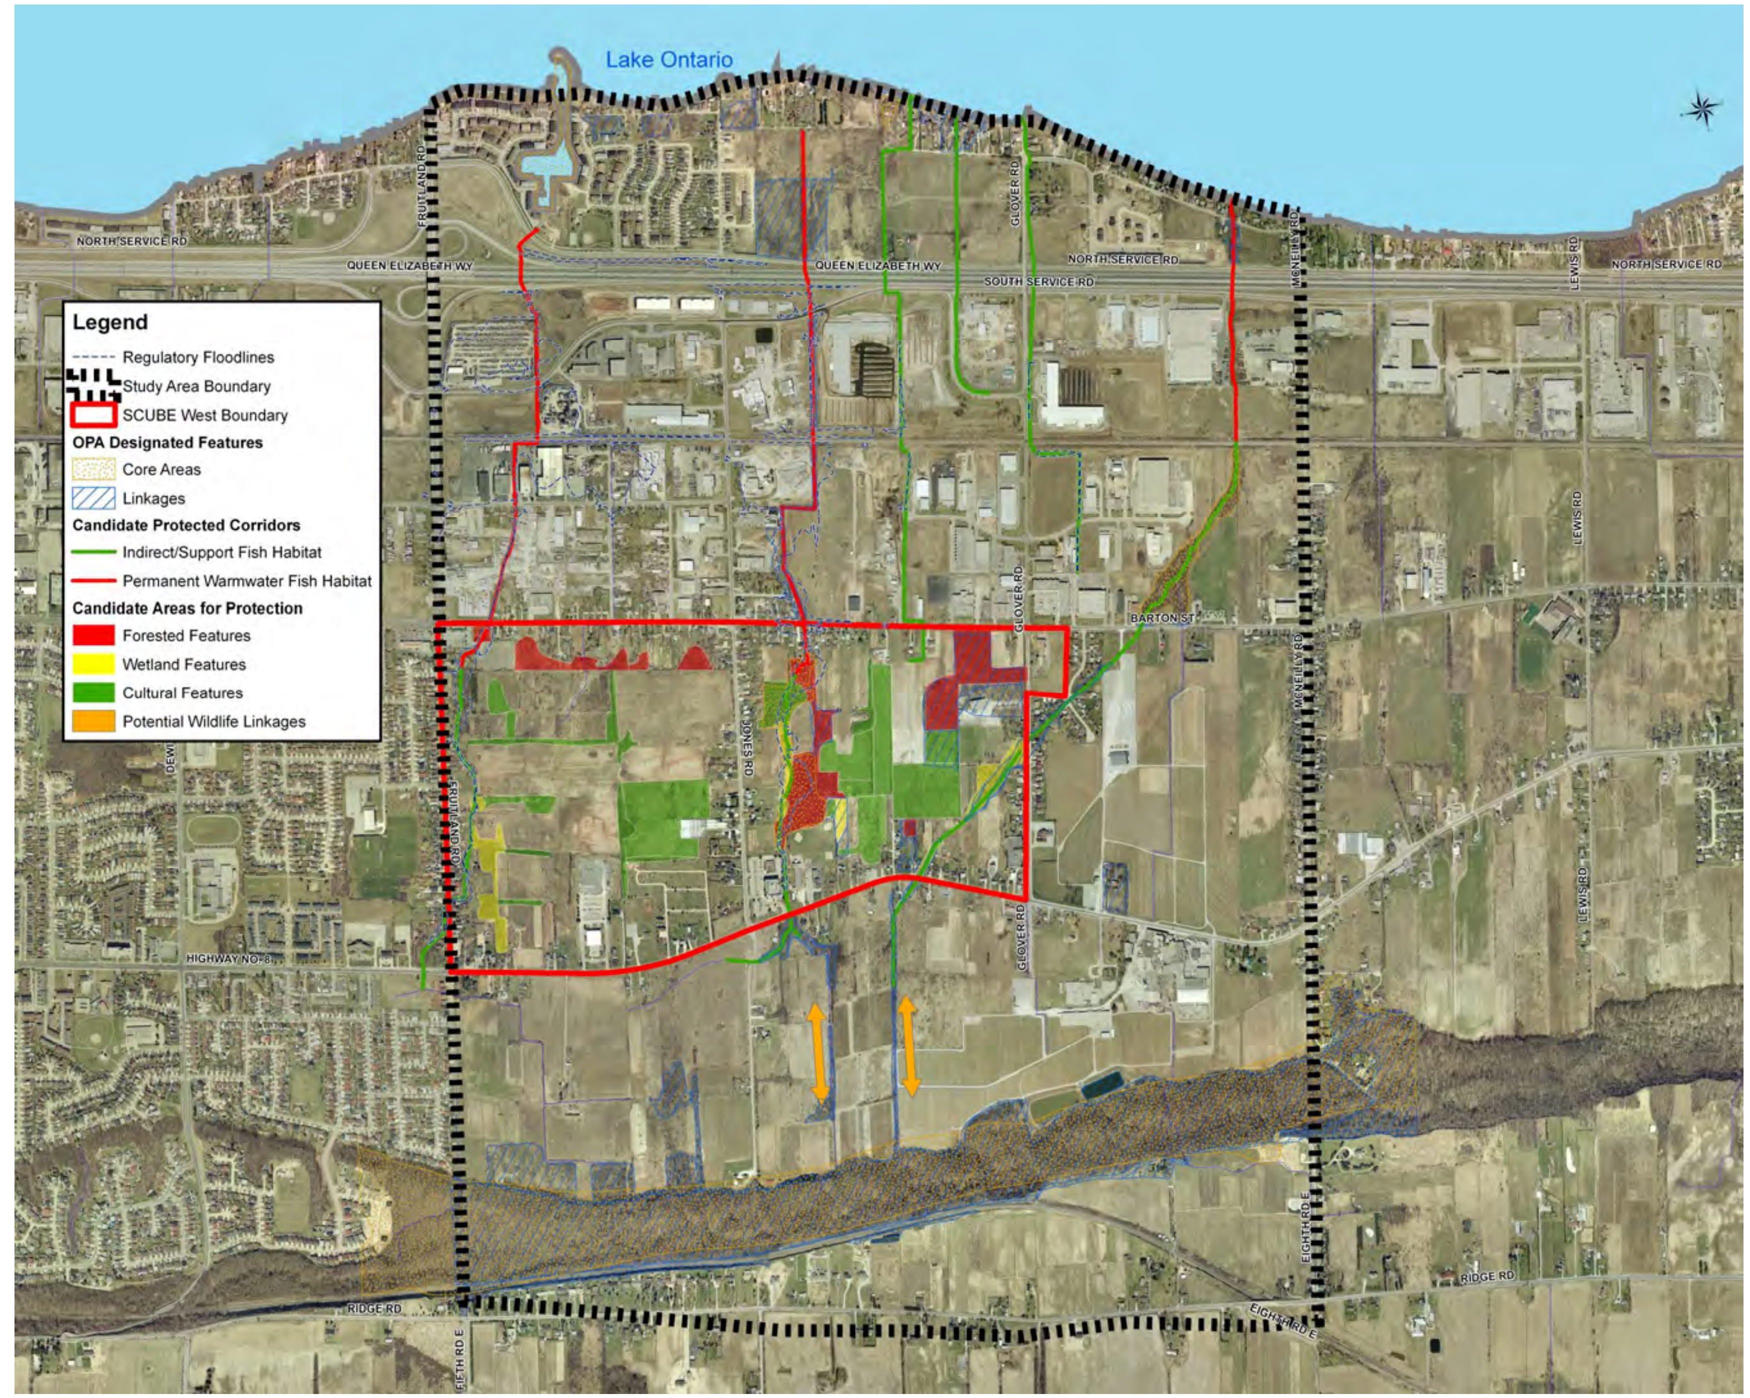
- Regulatory floodplain limits
- Candidate Protected Corridors
- Terrestrial Core Areas
- linkages
- Additional wetland habitat (yellow)
- Fisheries setbacks (from each streambank): 1) 15 m warmwater fishery setback; 2) 15 m indirect support habitat setback
- Slope Stability allowance
- Environmental/access setback
- Creeks are in private ownership in many areas

Developable Areas (Stormwater Management Requirements)

- Basic level of water quality treatment (level 2)
- Flood Control
- Erosion control
- Source Controls to maintain groundwater recharge area
- Culvert and channel improvements on lower watercourses

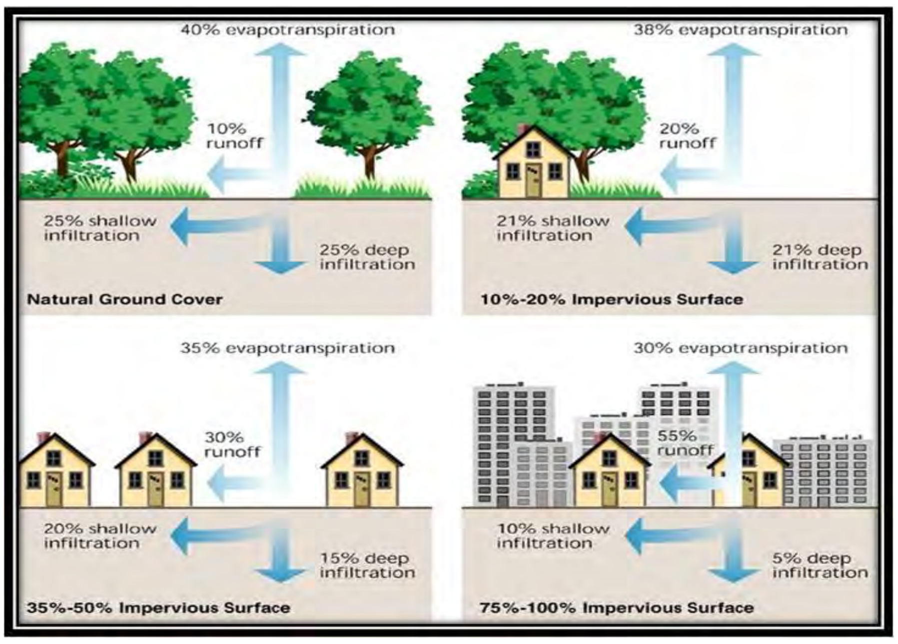
OPPORTUNITIES

- Preservation of forest and wetland areas
- Enhancement of riparian vegetation along warmwater streams
- Protection of important groundwater recharge area through rural land stewardship practices
- Revegetation of wildlife corridors along potential linkage areas through stewardship measures



IMPACTS FROM FUTURE DEVELOPMENT

- Increased runoff volumes
- Increased flood flow and erosion
- Decreased water quality
- Lower groundwater recharge
- Potential decreased baseflow
- Negative impacts to downstream fisheries



STONEY CREEK URBAN BOUNDARY EXPANSION WEST

Subwatershed Study
Public Information Centre No.# 1
Date: June 24, 2010

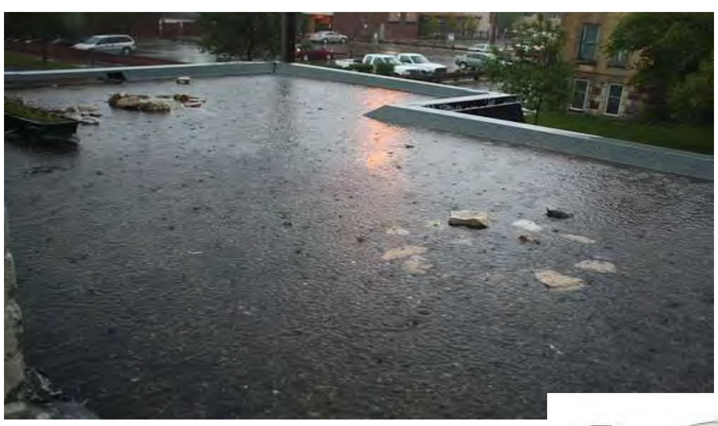
STORMWATER MANAGEMENT (SWM) ALTERNATIVES

Do Nothing

This option involves developing the SCUBE West lands without stormwater management. This alternative would result in a substantial increase in runoff, flooding, erosion and also water quality degradation.

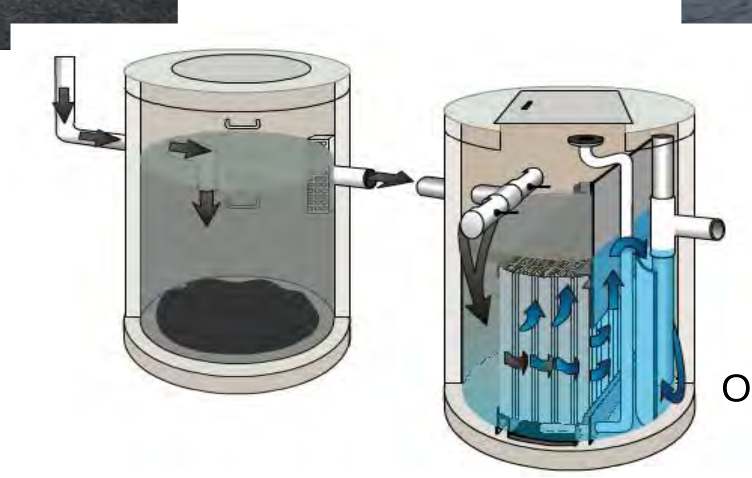
Traditional Source Controls

These measures are typically used within high-density forms of development such as commercial or industrial landuses. Rooftops, parking lots, or oversized storm sewers can be used to temporarily store rainfall from large storm events, while oil-grit separator devices can improve water quality.



Rooftop storage

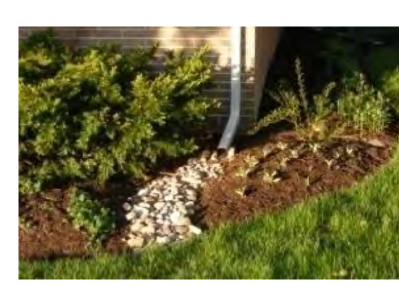
Parking lot storage



Oil & Grit separator

Low Impact Development (LID) Source Controls

This option involves addressing SWM using lot level controls/source controls that encourage the infiltration of water into the ground and reduce stormwater runoff. These systems would be integrated into the design of future urban developments and can include green roofs, permeable pavement, soakaway pits, bioretention, downspout disconnection etc.



Environment and Sustainable Infrastructure Division
Public Works, City of Hamilton

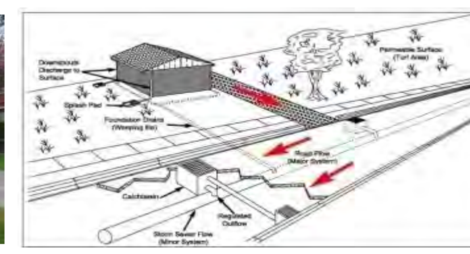
STONEY CREEK URBAN BOUNDARY EXPANSION WEST

Subwatershed Study
Public Information Centre No.# 1
Date: June 24, 2010

STORMWATER MANAGEMENT (SWM) ALTERNATIVES

Conveyance Controls

These controls are linear stormwater transport systems that are generally located within the road right-of-way where they encourage infiltration of water into the ground, improve water quality and reduce runoff. They can include traditional curb and gutter systems, bio-swales, grassed channels and subsurface perforated pipe systems.



End-of-pipe Controls

This option involves addressing SWM using conventional stormwater facilities at the end of the flow conveyance system. These facilities are utilized for erosion, water quantity and quality control applications.

Wet pond

Dry pond

Wetland

Stream Restoration

This option involves the replanting of floodplain and native stream side vegetation to improve stream corridor functions and water quality, slowing runoff, moderating stream temperatures, reducing erosion and improving aquatic and terrestrial habitat conditions.

Created channel

Wetland feature

Linear wetland feature

Naturalized corridor

DETAILED ASSESSMENT CRITERIA

Physical and Natural Environment

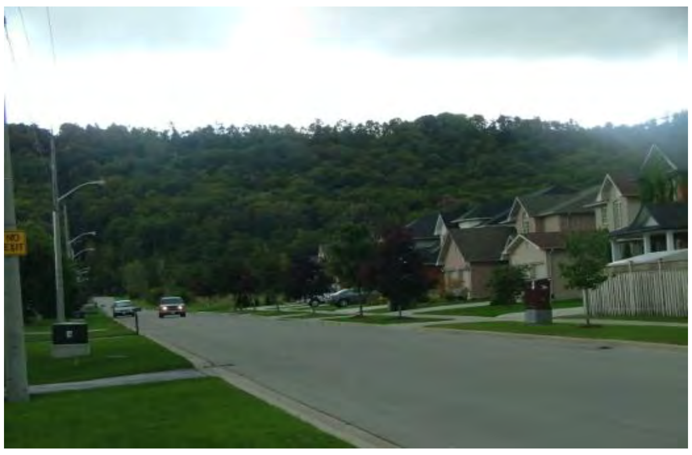
- Impact on vegetation, fish, and wildlife, surface drainage and groundwater, soils and geology;
- Meeting legislated criteria for flooding, water quality, and erosion;
- Impact on terrestrial and aquatic habitat: Connectivity, Diversity and Sustainability

Social, Economic and Cultural Environment

- Impact on existing and proposed development;
- Aesthetic value;
- Potential benefit to community and public acceptance; and
- Coordination with proposed roadway design.

Technical Factors

- Level of service- proven effectiveness;
- Regulatory agency acceptance;
- Impact on existing infrastructure;
- Constructability; and
- Maintenance requirements.



Financial Factors

- Capital cost;
- Operation and maintenance costs;
- Land requirements;
- Impact on property value; and
- Financial phasing considerations.

EVALUATION PROCESS

The project team has developed a set of Stormwater Management Alternatives for the SCUBE West lands. In order to manage the complexity and constraints inherent within the study area for stormwater management and to ensure a transparent selection process that considers all possible design alternatives, a two-phased approach has been used.

Screening Level Assessment

Are the Alternatives Feasible?

Yes

No

This phase is intended to identify those alternatives that are feasible (and infeasible) for use in the SCUBE West lands. Nine (9) screening level assessment criteria have been utilized to determine which SWM alternatives are to be carried forward to the more detailed assessment phase.

Detailed Assessment

Score the Alternatives & Rank

Rank 1

Rank 2 …etc

Select Preferred Alternative

The feasible options carried forward from screening level assessment have been used to develop SWM alternatives for SCUBE West lands. Alternatives are made up of both individual approaches and combinations of approaches (consistent with the MOE's treatment train approach to SWM).

The Detailed Assessment is a much more rigorous and thorough assessment of each alternative, based on a set of evaluation criteria. Each alternative is given an aggregate score indicating its rank based on social, economic and environmental criteria.

Implementation Considerations

Identify individual stormwater techniques that make up the Preferred Alternative

This step involves identifying which specific techniques are best suited for each landuse within the study area, together with cost estimates, construction / phasing considerations, and funding responsibilities. This will be completed as part of a future Third Phase of the Subwatershed Study.

SCREENING LEVEL ASSESSMENT

Screening Level Criteria

The primary criteria used in the evaluation include:
- Technical feasibility;
- Ability to meet targets;
- Flooding, Water quality, Erosion and Water balance;
- Cost effectiveness;
- Land requirements;
- Public acceptance; and
- Regulatory agency approval.

	Technical Feasibility	Flooding	Water Quality	Erosion	Water Balance	Cost Effectiveness	Land Requirements	Public Acceptance	Regulatory Agency Approval	Overall

Traditional Source Control (storage)	E	E	P	G	P	G	G	G	F	G
LID Source Control (infiltration / filtration)	E	P	E	E	E	P	F	G	E	G
Conveyance Control Measures										
LID Conveyance (infiltration / filtration)	E	F	G	G	G	G	G	G	G	G
End-of Pipe Measures										
Wet pond	E	E	G	F	P	G	F	E	E	G
Wetland	E	E	E	G	P	P	NA	G	G	NA
Dry Pond	E	E	P	G	P	G	F	NA	P	NA
Stream Restoration	G	P	G	E	F	P	G	G	E	G
	E=Excellent, G= Good, F = Fair, P=Poor, NA = Not Acceptable									

Source Control Measures, including both traditional and LID methods, together with Conveyance Control Measures, End-of-Pipe Wet Ponds and Stream Restoration meet the screening-level criteria and are carried forward to the detailed assessment.

End-of-Pipe Wetlands tend to be inconsistent with higher-density urban settings due to the relatively large land area requirements, while Dry Ponds rank poorly in several categories and are not generally favored by the public or regulatory agencies. These techniques, together with the "Do Nothing" alternative, which is not acceptable under several categories, were not carried forward to the detailed assessment.

DETAILED ASSESSMENT

Alternative #		Physical and Natural Environment	Social and Cultural Environments	Technical Criteria	Financial Criteria	Aggregate Score
	Sole-measure Alternatives					
1	Traditional Source Controls Only	1.8	1.8	3.0	3.2	9.8
2	LID Source Controls Only	2.4	3.0	2.4	3.0	10.8
3	LID Conveyance Controls Only	2.0	2.0	2.2	2.4	8.6
4	end-of-pipe Wet Pond Only	2.6	3.3	3.6	2.2	11.7
	Combined Source Control Alternatives					
5	Traditional Source Controls and LID Source Controls	3.0	3.3	2.8	2.8	11.9
	Combined Source & Conveyance Alternatives					
6	Traditional Source & LID Conveyance Controls	2.6	2.0	2.6	2.2	9.4
7	LID Source & LID Conveyance Conrtols	2.6	2.8	2.2	2.4	10.0
	Combined Source & End-of-pipe Alternatives					
8	LID Source Controls & end-of-pipe Wet Pond	3.6	3.8	3.0	2.0	**12.4****
	Combined Source, Conveyance and End-of-pipe Alternatives					
9	LID Source Controls, LID Conveyance Controls & end-of-pipe Wet Pond	4.0	3.8	2.6	1.4	11.8
10*	**Stream Restoration ***	3.0	3.5	2.6	2.8	**11.9***

1 = Poor
2 = Fair
3 = Good
4 = Excellent

* This alternative is not intended as a stand-alone measure. Instead, it is common to all other alternative as it is recommended as part of the Natural Heritage Strategy. Therefore, it will be recommended regardless of which alternative is preferred.

** The preferred alternative for the SCUBE (West) study area is Option 8 - LID Source Controls in combination with end-of-pipe Wet Ponds, along with Stream Restoration Measures.

DETAILED ASSESSMENT

Following the Screening Assessment the project team developed alternatives to address the EA SWM objectives. The criteria developed to satisfy the SWM objectives were used to score the alternatives and select/identify the preferred alternative.

		Physical and Natural Environment					Social and Cultural Environments				Technical Criteria					Financial Criteria					
Alternative #		Water Balance	Flooding	Surface Water Quality	Erosion	Terrestrial & Aquatic Habitat	Existing Land Uses	Aesthetic Value	Benefit to Community & Public Acceptance	Coordination with proposed roadway design	Level of service-proven effectiveness	Regulatory agency acceptance	Impact on existing infrastructure	Constructability	Maintenance Requirements	Capital costs	Operations and Maintenance Costs	Land Requirements	Impacts on property value	Phasing Considerations	**Aggregate Score**
	Sole-measure Alternatives

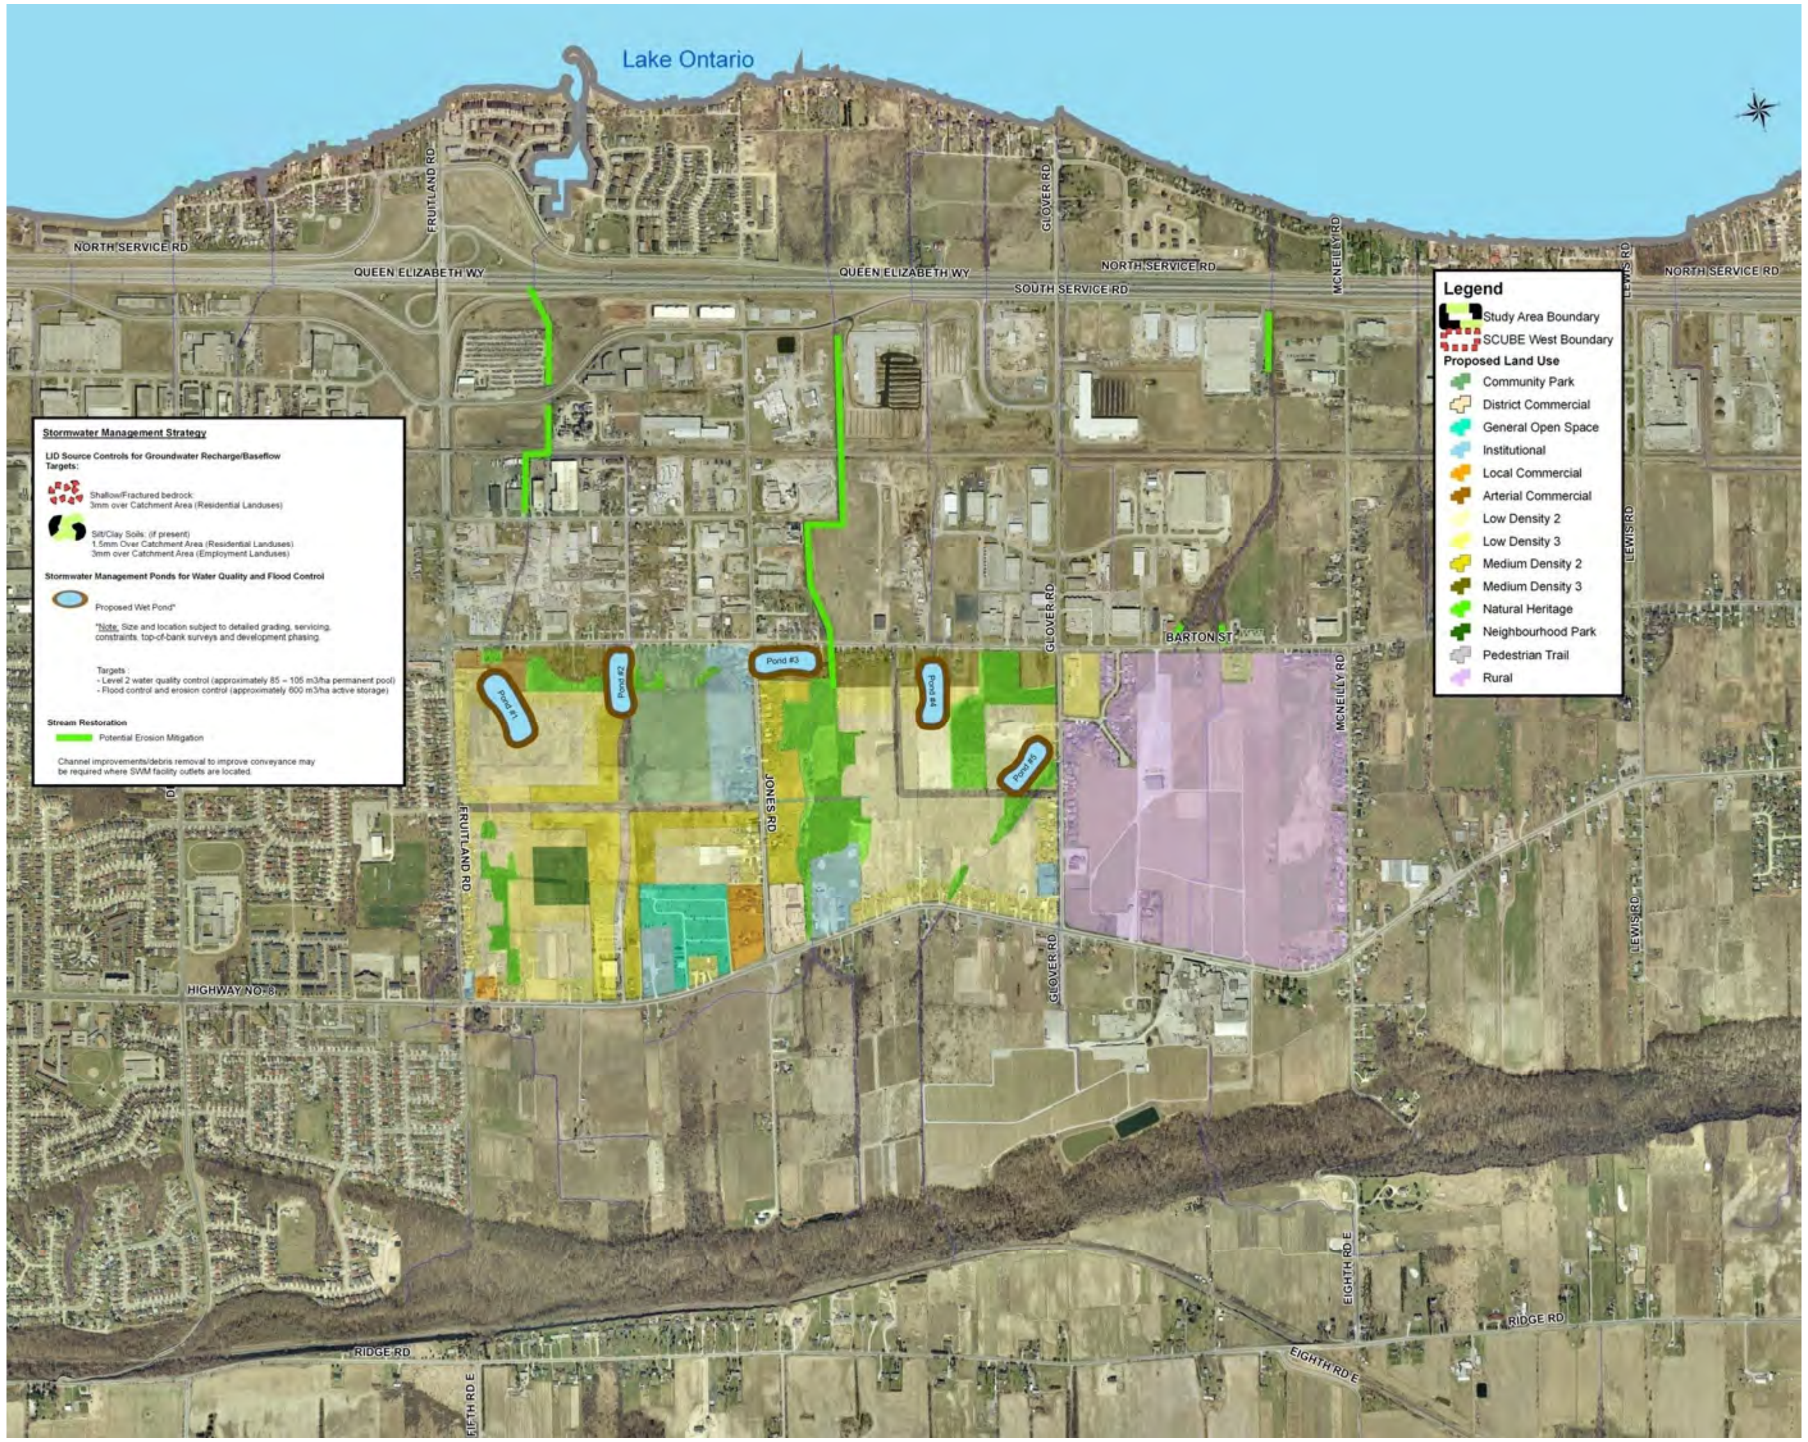
STONEY CREEK URBAN BOUNDARY EXPANSION WEST

Subwatershed Study

Public Information Centre No.# 1
Date: June 24, 2010

PRELIMINARY PREFERRED STORMWATER MANAGEMENT STRATEGY



The Preliminary Preferred Stormwater Management Strategy consists of 3 key measures:

1. **Low Impact Development (LID) Source Controls**

These measures encourage infiltration of water into the ground.

Benefits:
- Reduces stormwater runoff
- Improves water quality
- Promotes baseflow in streams

Targets:
- For fractured/shallow bedrock, infiltrate 3mm over catchment area (residential landuses)
- For silt/clay soils, infiltrate 1.5mm to 3mm over the catchment area (residential / employment landuses)

2. **Wet Ponds and Traditional Source Controls**

These measures store and gradually release stormwater runoff.

Benefits:
- Controls flooding
- Improves water quality

Targets:
- Up to 105m^3/ha of permanent pool storage
- Approximately 550m^3/ha of active storage

3. **Stream Restoration**

These measures involve re-planting of streamside vegetation and removal of fish barriers.

Benefits:
- Improves fish and terrestrial habitat
- Improves water quality
- Moderates stream temperatures
- Reduces erosion

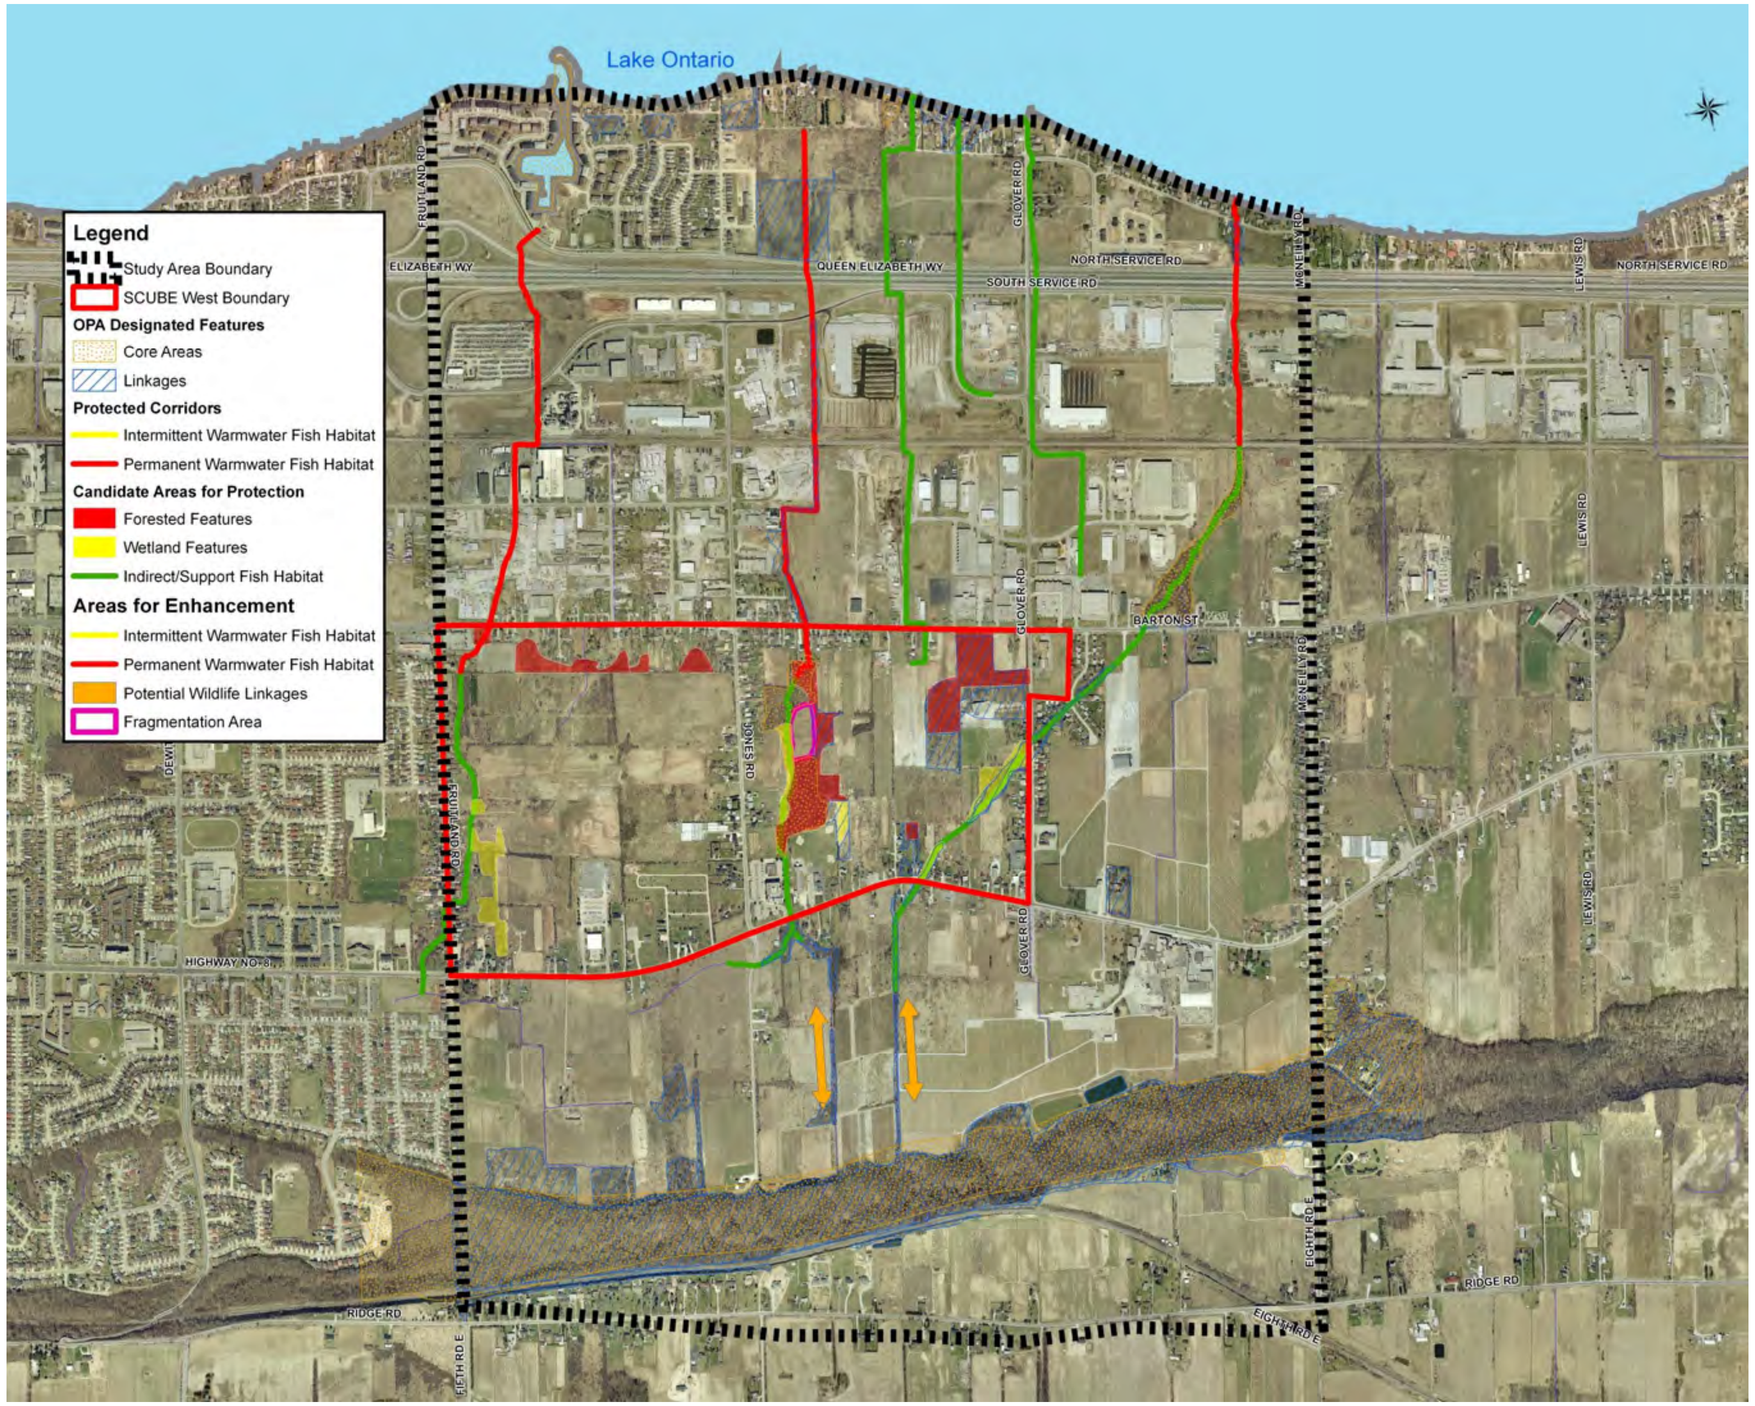
RECOMMENDED NATURAL HERITAGE SYSTEM



The Natural Heritage System for the SCUBE West subwatershed is an interconnected mosaic of existing forests, wetlands, meadows and stream/valley corridors, connected to the larger Natural Heritage System of the City of Hamilton that includes features within the Niagara Escarpment and the Lake Ontario shoreline.

Natural features are sparsely distributed within the drainage features within the SCUBE subwatershed and primarily limited to several woodlots and some riparian forested and meadow habitats along W.C. 6 and 7. Natural linkages between the Lake Ontario shoreline and the Niagara Escarpment are limited and currently occur along the headwater tributaries of W.C. 7 and generally across the existing agricultural landscape.

The Recommended Natural Heritage System is shown on the attached map and consists of Terrestrial Core Areas and Linkages, and Protected Stream Corridors. In addition, there are a number of Candidate Areas for Protection as Core/Linkage Areas and some Enhancement Areas where potential terrestrial and aquatic linkages could be improved through native vegetation plantings.

Next Steps

Following this Public Information Center, the following tasks will be completed:

- Finalize the recommended Stormwater Management Plan
- Finalize the recommended Natural Heritage System
- Develop an Implementation Plan (Phase 3)

If you have any questions, comments, please contact.

Comments

A PORTION OF THE LAND AT 212 FRUITLAND RD HAS BEEN DESIGNATED AS WETLANDS. THIS IS AN ERROR! THE AREA SO MARKED WAS A VINEYARD IN YEARS PAST AND ~~IS~~ HAS SIMPLY GROWN OVER WITH BUSHES & TREES. PLEASE HAVE IT CHANGED ON FUTURE MAPS & DOCUMENTS.

Note: With the exception of personal information, all comments will become part of the public record and a copy of this document may be attached to future reports.

Please provide your property address. Also provide your name and phone number so that we may contact you if necessary. The bottom of this page will be excluded from future reports

Comments

OUR CONCERNS ARE RELATED TO HOW THE CURRENT AND PROPOSED DRAINAGE FLOWS INTO THE MARINA ~~AS~~ EAST OF FRUITLAND ROAD. THIS RUNOFF IN THE "NATURAL" CREEKS IS HEAVILY POLLUTED BOTH WITH OIL PRODUCTS AND DEBRIS AS WELL AS "NATURAL" SILT FROM UPSTREAM. THIS PROBLEM HAS BEEN DISCUSSED MANY TIMES OVER THE YEARS AND NOW WOULD BE A PRIME TIME TO INCLUDE A RESOLUTION TO THE PROBLEM. THE CREEK MAY BE "NATURAL" BUT ~~THE~~ MANY POLLUTANTS ARE DERIVED FROM HUMAN ACTIVITY.

I WOULD SUGGEST THAT AFTER THE NEXT SIGNIFICANT RAINFALL THAT YOUR PLANNERS VISIT THE TWO HARBOUR OUTFALLS AND WITNESS THE CONDITIONS.

Comments

We have pease of land at congession 1 LOT 1 and we are concerned regarding two pounds wich would take most of oor Frontige ~~of~~ on service rd.
I would like to discus with somone before is two Late.
One proposal is without powns and onother with two ponds wich will take most of frontige.

Would you please luke in to diferent solution, that we have som of oor land with dissent frontige.

Comments

It is a Disgrace
City of Hamilton has been
dumping road run off and
toxic waste into the
Newport Marina for a number
of years !! This MUST STOP
City must remove culverts which dump
this run off immediately and
re direct these two large pipes
to meet the large Fruitland
Road Sewer line.
We do not want to live next to
a Sewer !! Please remove these
pipes going into New Port Marina
Before all this goes public -

Comments

Creek (Storm Sewer Run Off) constantly floods

We have many photos taken from 1986 to date

Resevoir on S/W corner of Hwy 8 & Fruitland Rd useless

We're losing 1 ft of property into creek bed each year

Old trees that used to be on dry land are now right in the creek bed - Roots exposed - Trees falling

2 weeks ago large mature tree fell on our house

Many more are in danger of falling considering the amount of rainfall.

Note: With the exception of personal information, all comments will become part of the public record and a copy of this document may be attached to future reports.

Please provide your property address. Also provide your name and phone number so that we may contact you if necessary. The bottom of this page will be excluded from future reports

1. COSEWIC Status. COSEWIC (Committee on the Status of Endangered Wildlife in Canada) assigns a federal status ranking for all species that it assesses. Ranking definitions are as follows:

Endangered (E) - A wildlife species facing imminent extirpation or extinction.

Threatened (T) - A wildlife species that is likely to become endangered if nothing is done to reverse the factors leading to its extirpation or extinction.

Special Concern (SC) - A wildlife species that may become threatened or endangered because of a combination of biological characteristics and identified threats.

Not at Risk (NAR) - A wildlife species that has been evaluated and found to be not at risk of extinction given the current circumstances.

2. COSSARO Status. COSSARO (Committee on the Status of Species at Risk in Ontario) assigns a provincial status ranking for all species that it assesses. Ranking definitions are as follows:

Extinct – the species no longer lives anywhere in the world.

Extirpated – the species lives somewhere in the world, and at one time it lived in the wild in Ontario, but it no longer lives in the wild in Ontario.

Endangered – the species lives in the wild in Ontario but is facing imminent extinction or extirpation.

Threatened – the species lives in the wild in Ontario, is not endangered, but is likely to become endangered if steps are not taken to address factors threatening it.

Special Concern – the species lives in the wild in Ontario, is not endangered or threatened, but may become threatened or endangered due to a combination of biological characteristics and identified threats.

3. G-rank: Global ranks are assigned by a consensus of the network of Conservation Data Centres, scientific experts and The Nature Conservancy to designate a rarity rank based on the range-wide status of a species, subspecies or variety.

G1 - Extremely rare; usually 5 or fewer occurrences in the overall range or very few remaining individuals; or because of some factor(s) making it especially vulnerable to extinction.

G2 - Very rare; usually between 5 and 20 occurrences in the overall range or with many individuals in fewer occurrences; or because of some factor(s) making it vulnerable to extinction.

G3 - Rare to uncommon; usually between 20 and 100 occurrences; may have fewer occurrences, but with a large number of individuals in some populations; may be susceptible to large-scale disturbances.

G4 - Common; usually more than 100 occurrences; usually not susceptible to immediate threats.

G5 - Very common; demonstrably secure under present conditions.

4. S-rank: Provincial (or Subnational) rank by the MNR Natural Heritage Information Centre (NHIC) to set protection priorities for rare species and natural communities.

S1 - Critically Imperiled - Critically imperiled in the state/province because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province.

S2 - Imperiled - Imperiled in the province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the province.

S3 - Vulnerable - Vulnerable in the province due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation

S4 - Apparently Secure - Uncommon but not rare; some cause for long-term concern due to declines or other factors.

S5 - Secure - Common, widespread, and abundant in the province.

5. Status in the City of Hamilton as defined by the Hamilton Natural Areas Inventory (Dwyer 2003)

H - Rare in the City of Hamilton (see Dwyer 2003 for complete definition).

h - Uncommon in the City of Hamilton (see Dwyer 2003 for complete definition).

ex – Considered extirpated from the City of Hamilton.

I - Considered introduced in the City of Hamilton.

6. Coefficient of Conservation: Numeric value between 0 and 10 which indicates the degree of faithfulness a plant displays to a specific habitat or set of environmental conditions. Conservative plant species, such as those which are only found in relatively pristine natural habitats such as bogs or prairies, are assigned a high coefficient of conservatism; other plant species which grow in a wide variety of habitats and can tolerate high levels of cultural disturbance are assigned low values.

7. Observed during fieldwork by Dillon Consulting Limited (2010).

8. Observed during fieldwork by Natural Resources Solutions Incorporated.

9. Observation records obtained on April 13, 2011 from the Natural Heritage Information Centre database for squares 17PH08_74, 17PH08_84, 17PH08_86, 17PH08_94, 17PH08_96, 17PH18_04, 17PH18_05, 17PH18_14, 17PH18_15, 17PH18_24 and 17PH18_25.

10. Fifty Creek Valley ESA species observation records from the City of Hamilton Natural Heritage Database obtained from Hamilton Conservation Authority on February 28, 2011.

11. Devil's PunchBowl Escarpment ESA species observation records from the City of Hamilton Natural Heritage Database obtained from Hamilton Conservation Authority on February 28, 2011.

12. Rare species observation records from Devil's PunchBowl Escarpment ESA from the City of Hamilton Natural Heritage Database obtained from Hamilton Conservation Authority on February 28, 2011.

13. Observed during fieldwork by North South Environmental Incorporated.

14. Records obtained from Bird Studies Canada's EBIRD database for the study area of the SCUBE Subwatershed Study and immediately surrounding area.

15. Records obtained from Bird Studies Canada's Great Backyard Bird Count database for the study area of the SCUBE Subwatershed Study and immediately surrounding area.

16. Records obtained from Bird Studies Canada's Ontario Breeding Bird Atlas database for the study area of the SCUBE Subwatershed Study and immediately surrounding area.

APPENDIX H:

MNR List of COSSARO-designated Species at Risk Known or Suspected to Occur in the City of Hamilton

HAMILTON

Species At Risk Designations	
ENDANGERED	(red)
THREATENED	(yellow)
SPECIAL CONCERN	(green)
EXTIRPATED	(white)

AMPHIBIANS		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey
Jefferson Salamander (***Ambystoma jeffersonianum***)	**Known to Occur**	*Habitat Regulations*	inhabit deciduous and mixed deciduous forests with suitable breeding areas which generally consist of ephemeral (temporary) bodies of water that are fed by spring runoff, groundwater, or springs.	Active: March – October Hibernates: October – March Breeding: Late March - Mid April	Contact local MNR office for a copy

BIRDS		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey
Acadian Flycatcher (***Empidonax virescens***)	**Known to Occur**	*Species Protection Only*	generally requires large areas of mature, undisturbed forest; avoids the forest edge; often found in well wooded swamps and ravines	Migrate South before Winter	**When to survey:** - good weather: winds <19km/hr (<3 on the Beaufort scale); no thick fog or precipitation - peak breeding season (May 24-July 10) - between dawn and 5 hours after dawn **How to survey:** -stand still & listen for a given period of time (5 minutes for the breeding bird atlas) and record any SAR birds seen or heard during this time. The following behaviours may tell you whether it is a breeding bird rather than a migrant visitor:
Bald Eagle (***Haliaeetus leucocephalus***)	**Known to Occur**	*N/A*	prefers deciduous and mixed-deciduous forest; and habitat close to water bodies such as lakes and rivers; They roost in super canopy trees such as Pine	Breed and Nest - April or May Some Migrate South when water bodies freeze over	• Nests are easy to spot from water or air • Adults may travel long distances from nest to hunt • Nesting may begin as early as February/March
Barn Owl (***Tyto alba***)	**Known to Occur**	*Habitat Regulations*	generally prefer low-elevation, open country; often associated with agricultural lands, especially pasture. Nests are located in buildings, hollow trees and cavities in cliffs.	Active Year Round Some leave for the Winter	• Buildings can be surveyed for clues such as pellets and droppings or presense of individuals • Night surveys may be helpful as they are very vocal
Black Tern (***Childonias niger***)	**Known to Occur**	*N/A*	generally prefer freshwater marshes and wetlands; nest either on floating material in a marsh or on the ground very close to water	Migrate South for the Winter	Watch for them conspicuously hunting throughout the day in their suitable habitat.
Bobolink (***Dolichonyx oryzivorus***)	**Known to Occur**	*Habitat Protection*	generally prefers open grasslands and hay fields. In migration and in winter uses freshwater marshes and grasslands	Migrate South for the Winter	• Follow Breeding Bird Survey Protocol

Cerulean Warbler ***(Dendoica cerulea)***	**Known to Occur**	*Species Protection Only*	generally found in mature deciduous forests with an open understorey; also nests in older, second-growth deciduous forests.	Migrate South for the Winter	• Follow Breeding Bird Survey Protocol
Chimney Swift (***Chaetura pelagica***)	**Known to Occur**	*Habitat Protection*	historically found in deciduous and coniferous, usually wet forest types, all with a welldeveloped, dense shrub layer; now most are found in urban areas in large uncapped chimneys	Nesting - Late April to Mid- May Migrate South in September or Early October	• Watch for them foraging high in the sky, usually in groups • Most likely encountered in oldest sections of towns, with old buildings (churches, etc) that still have large brick/masonry chimneys • Surveys can be conducted at any time in the breeding season • A minimum of 2 visits at least 7 days apart • Best time for surveying is a dusk before and as they enter the roost
Common Nighthawk (***Chordeiles minor***)	**Suspected to Occur**	*N/A*	generally prefer open, vegetation-free habitats, including dunes, beaches, recently harvested forests, burnt-over areas, logged areas, rocky outcrops, rocky barrens, grasslands, pastures, peat bogs, marshes, lakeshores, and river banks. This species also inhabits mixed and coniferous forests. Can also be found in urban areas (nest on flat roof-tops)	Migrate South for the Winter	**When to Look/Listen:** • Time of day: dusk and the few hours following. • Flashlight surveys for nesting adults are done in the dark. **How to Look/Listen:** • set up survey routes with counts at regular intervals in desired habitat • Look and Listen for them flying above open areas just before dusk, making a nasal "peent" call. • Males perform an aerial display over nest site which consists of deep dives resulting in a "sonic boom" • Incubating females or silent males on the ground at night can be spotted using a powerful flashlight to scan open areas or their conspicuous eye shine.
Henslow's Sparrow ***(Ammodramus henslowii)***	**Historically Known to Occur**	*Species Protection Only*	generally found in old fields, pastures and wet meadows. They prefer areas with dense, tall grasses, and thatch, or decaying plant material	Migrate South for the Winter	• Follow Breeding Bird Survey Protocol
Hooded Warbler ***(Wilsonia citrina)***	**Known to Occur**	*N/A*	generally found in the Carolinian Zone, in the interiors of large upland tracts of mature deciduous and mixed forest, and in ravines; can breed in low shrubbery such as raspberry canes	Breed from Late May to Early July	• Follow Breeding Bird Survey Protocol
King Rail ***(Rallus elegans)***	**Known to Occur**	*Species Protection Only*	generally this species requires large marshes with open shallow water that merges with shrubby areas	Breed from Late April to mid-May Migrate South for the Winter	• Follow MMP protocol; Very difficult to detect.
Least Bittern ***(Ixobrychus exilis)***	**Known to Occur**	*Species Protection Only*	generally located near pools of open water in relatively large marshes and swamps that are dominated by cattail and other robust emergent plants	Migrate South for the Winter	• Follow MMP protocol; 10 day window of male calling (variable timing). Does not respond well to playback. Very difficult to detect.

Louisiana Waterthrush ***(Seiurus motacilla)***	**Known to Occur**	*N/A*	generally inhabits mature forests along steeply sloped ravines adjacent to running water. It prefers clear, cold streams and densely wooded swamps	Migrate South for the Winter	• Follow Breeding Bird Survey Protocol
Peregrine Falcon ***(Falco peregrinus)***	**Known to Occur**	*Habitat Regulations*	generally nest on tall, steep cliff ledges adjacent to large waterbodies; some birds adapt to urban environments and nest on ledges of tall buildings, even in densely populated downtown areas.	Active Year Round Lay Eggs around Easter Hatching occurs around Mother's Day Young fledge around Father's Day	• Visit ideal habitat locations and listen/look for individuals in the vicinity.
Prothonotary Warbler ***(Protonotaria citrea)***	**Known to Occur**	*Species Protection Only*	generally found in the dead trees of flooded woodlands or deciduous swamp forests; Carolinian zone	Migrate South for the Winter Eggs are layed from Late May - Early July	• Follow Breeding Bird Survey Protocol or look for nesting birds
Red-Headed Woodpecker ***(Melanerpes erythrocephalus)***	**Known to Occur**	*N/A*	generally prefer open oak and beech forests, grasslands, forest edges, orchards, pastures, riparian forests, roadsides, urban parks, golf courses, cemeteries, as well as along beaver ponds and brooks	Active from May to September	• Follow Breeding Bird Survey Protocol
Short-eared Owl ***(Asio flammeus)***	**Known to Occur**	*N/A*	generally prefers a wide variety of open habitats, including grasslands, peat bogs, marshes, sand-sage concentrations, old pastures and agricultural fields	Active Year Round	• Follow breeding bird survey protocol • Look and Listen at Dusk in appropriate habitat
Yellow-breasted Chat ***(Icteria virens)***	**Known to Occur**	*N/A*	generally prefer dense thickets around wood edges, riparian areas, and in overgrown clearings	Migrate South for the Winter Arrive in Ontario Early May	• Follow Breeding Bird Survey Protocol
FISH			**Key Habitats Used By Species**	**Timing Of Life History Events**	**How to Conduct a Proper Survey**
American Eel ***(Anguilla rostrata)***	**Known to Occur**	*Species Protection Only*	all fresh water, estuaries and coastal marine waters that are accessible to the Atlantic Ocean; 12-mile creek watershed and Lake Ontario	Active Year Round	• Electrofishing For information please contact your local MNR office, DFO, and Lakes and Rivers
Grass Pickerel ***(Esox americanus vermiculatus)***	**Known to Occur**	*N/A*	generally occur in wetlands with warm, shallow water and an abundance of aquatic plants; occur in the St. Lawrence River, Lake Ontario, Lake Erie, and Lake Huron	spawn in Ontario from late March to early May	For information please contact your local MNR office, DFO, and Lakes and Rivers
Redside Dace ***(Clinostomus elongatus)***	**Known to Occur**	*Habitat Protection*	generally found in pools and slow-moving areas of small headwater streams with a moderate to high gradien	Spawning occurs in May	• Minnow Trapping For information please contact your local MNR office, DFO, and Lakes and Rivers
INSECTS		ESA Protection	**Key Habitats Used By Species**	**Timing Of Life History Events**	**How to Conduct a Proper Survey**

Monarch Butterfly ***(Danaus plexippus)***	Known to Occur	*N/A*	exist primarily wherever milkweed and wildflowers exist; abandoned farmland, along roadsides, and other open spaces	Migrate South for the Winter Usually in Late September and October	• Watch for adults along roadsides and in open fields • Caterpillars feed on milkweeds: Common milkweed grows in open disturbed habitats (fields, roadsides, etc) and swamp milkweed grows in wet habitats (along streams, lakes, marshes) • Adults can be spotted from a distance; caterpillars must be looked for carefully on the host plant.

MAMMALS		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey
American Badger ***(Taxidea taxus jacksoni)***	Known to Occur	*Habitat Regulations*	generally prefer open habitats, whether natural (grasslands) or man-made (agricultural fields, road right-of-ways, golf courses)	Breed: Late Summer Semi-dormant over Winter	• Determine if soils are suitable (sandy or loamy) • Dens and Woodchuck burrows should be surveyed for use
Woodland Vole ***(Microtus pinetorum)***	Known to Occur	*N/A*	generally associated with deciduous forests in areas of soft, friable, often sandy soil beneath deep humus, where it can burrow easily.	Active Year Round	The best way to document its presence is with traps. Abundances typically are highest during late summer and fall and it is during this time period that trapping efforts should be most successful. Evidence of its tunnels may be apparent in leaf litter as well as its angular chew marks on vegetation near or in passageways

MOLLUSCS		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey

MOSSES		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey

PLANTS		ESA Protection	Key Habitats Used By Species	Timing Of Life History Events	How to Conduct a Proper Survey
American Chestnut ***(Castanea dentata)***	Known to Occur	*Species Protection Only*	found in deciduous forest communities; this tree prefers arid forests with acid and sandy soils.	Flowers occur in Late Spring and Early Summer	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species • Perform detailed floristic inventory • Look for distinictive fruits on the ground
American Columbo ***(Frasera caroliniensis)***	Known to Occur	*Species Protection Only*	most commonly associated with open deciduous forested slopes, thickets and clearings; grows in a variety of relatively stable habitats as well as on a wide variety of soils	Germination and development of the rosette begin in early spring; Flowers open in May; Fruit production continues until October or November	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species • Look for spikes from last years flowers
American Ginseng ***(Panax quinquefolius)***	Known to Occur	*Species Protection Only*	grows in rich, moist, undisturbed and relatively mature deciduous woods in areas of neutral soil (such as over limestone or marble bedrock).	Flowering begins in June and continues until August; The fruit develop from July to August and ripen in August and September	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species

Broad Beech Fern ***(Phegopteris hexagonoptera)***	**Known to Occur**	*N/A*	generally inhabits shady areas of beech and maple forests where the soil is moist or wet	The frond of the Broad Beech Fern appears towards the end of May	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species
Eastern Flowering Dogwood ***(Cornus florida)***	**Known to Occur**	*Habitat Protection*	generally grows in deciduous and mixed forests, in the drier areas of its habitat, although it is occasionally found in slightly moist environments; Also grows around edges and hedgerows	flowering occurs in mid-spring, just as the leaves begin to develop. Fruit turns red at the end of summer.	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species • Easiest to detect during Spring when in flower • Also look for distinctive bark
Few-flowered Club-rush ***(Trichophorum planifolium)***	**Known to Occur**	*Habitat Regulations*	generally found in Dry Fresh Oak deciduous forests and Dry Fresh Oak-Maple-Hickory deciduous forests (only found on RBG property)	Plants flower early before the forest canopy leafs in	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species
Green Dragon ***(Arisaema dracontium)***	**Known to Occur**	*N/A*	generally grows in damp deciduous forests and along streams.	Flowering occurs in May and June	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species
Red Mulberry ***(Morus rubra)***	**Known to Occur**	*Species Protection Only*	generally grows in moist forest habitats. In Ontario, these include slopes and ravines of the Niagara Escarpment, and sand spits and bottom lands; Can grow in open areas such as hydro corridors	Flowering occurs when leaves emerge in late spring. Fruit emerges in Mid-July.	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species
Spotted Wintergreen ***(Chimaphila maculata)***	**Historically Known to Occur**	*Species Protection Only*	generally grow in sandy habitats in dry-mesic oak-pine woods. In Canada, they grow very close to the Great Lakes	Flowering occurs in late July to early August	• Watch for the distinct evergreen leaves in suitable habitat • May be easiest to search in fall and spring
White Wood Aster ***(Eurybia divaricata)***	**Known to Occur**	*Species Protection Only*	generally grows in open, dry, deciduous forests. It has been suggested that it may benefit from some disturbance, as it often grows along trails.	Flowering occurs in early September, and sets fruit later in the month	• Walk slowly and systematically in grid fashion, pausing to scan for plants every 5 meters • Use a plant field guide to distinguish from similar species

REPTILES		ESA Protection	**Key Habitats Used By Species**	**Timing Of Life History Events**	**How to Conduct a Proper Survey**

Blanding's Turtle ***(Emydonidea blandingii)***	**Known to Occur**	*Species Protection Only*	generally occur in freshwater lakes, permanent or temporary pools, slow-flowing streams, marshes and swamps. They prefer shallow water that is rich in nutrients, organic soil and dense vegetation. Adults are generally found in open or partially vegetated sites, and juveniles prefer areas that contain thick aquatic vegetation including sphagnum, water lilies and algae. They dig their nest in a variety of loose substrates, including sand, organic soil, gravel and cobblestone. Overwintering occurs in permanent pools that average about one metre in depth, or in slow-flowing streams.	Eggs are laid in June, with hatchlings emerging in late September and early October.	Contact your local MNR office for more information
Eastern Hog-nosed Snake ***(Heterodon platirhinos)***	**Historically Known to Occur**	*Species Protection Only*	generally prefer habitats with sandy, well-drained soil and open vegetative cover, such as open woods, brushland, fields, forest edges and disturbed sites. The species is often found near water.	Mating occurs in spring and in August and early September. Hatching occurs in late August or early September	Contact your local MNR office for more information
Eastern Ribbonsnake ***(Thamnophis sauritus)***	**Known to Occur**	*N/A*	generally occur along the edges of shallow ponds, streams, marshes, swamps, or bogs bordered by dense vegetation that provides cover. Abundant exposure to sunlight is also required, and adjacent upland areas may be used for nesting.	Hibernate: October - April Mating: Early Spring Hatching: Early Fall (September)	• In April, look for individuals near wetlands • After April, look for individuals in the wetland vegetation, occasionally basking on boardwalks/rocks/tussocks.
Milksnake ***(Lampropeltis triangulum)***	**Known to Occur**	*N/A*	generally occur in rural areas, where it is most frequently reported in and around buildings, especially old structures. It is also found in a wide variety of habitats, from prairies, pastures, and hayfields, to rocky hillsides and a wide variety of forest types. They must also be in proximity of water, and suitable locations for basking and egg-laying.	Active at dawn and dusk in the spring and fall, and at night in the summer. Hibernate: Late October to Early May	• In areas exposed to sunlight, search under warm surfaces for basking snakes • Surveys using cover boards should be used in appropriate habitats • These surveys should continue for the length of at least one active season • Surveys for potential hibernation sites should be conducted
Northern Map Turtle ***(Graptemys geographica)***	**Known to Occur**	*N/A*	generally inhabits both lakes and rivers, showing a preference for slow moving currents, muddy bottoms, and abundant aquatic vegetation. These turtles need suitable basking sites (such as rocks and logs) and exposure to the sun for at least part of the day.	Active: At night Hibernate: October - April Hatching: Late August - Early September	• scan shoreline in spring and partially submerged logs/rocks in summer for basking turtles • Be aware that map turtles do not allow as close of approach as other turtles before leaving a basking site • Snorkel in desired aquatic habitat! • Nesting season: search suitable habitat for nests

Snapping Turtle ***(Chelydra serpentina)***	**Known to Occur**	*N/A*	generally inhabit shallow waters where they can hide under the soft mud and leaf litter. Nesting sites usually occur on gravely or sandy areas along streams. Snapping Turtles often take advantage of man-made structures for nest sites, including roads (especially gravel shoulders), dams and aggregate pits.	Nesting: Late May and June Hibernate: October - April	• Scan offshore rocks and logs for basking turtles (10am-2pm) • Snorkel in desired aquatic habitat! • Nesting Season: Search known or preferred nesting habitat areas for females
Spiny Softshell ***(Apalone spinifera)***	**Known to Occur**	*Species Protection Only*	generally prefer marshy creeks, swift-flowing rivers, lakes, impoundments, bays, marshy lagoons, ditches and ponds near rivers	Lay eggs in June or July Hibernate over winter	• Best time to survey is during nesting season when females are active laying eggs • Visual searches should be conducted in appropriate habitat

Species at Risk info is not available in LIO – you can get some of it from NHIC. It should be noted that because the province has not been surveyed comprehensively for the presence of species at risk, the absence of an element occurrence does not indicate the absence of the species. Consequently, the presence of element occurrences is useful to flag the presence of a species at risk in an area, but is not an appropriate tool to determine whether a species is present at the local (property-scale) level.

Given the above, the District is of the opinion that field surveys are necessary to determine whether species at risk occur on a property. The District provides the following advice with respect to determining the presence of species at risk on a property for which a land-use change is being proposed.

I. Botanical Inventory

The District recommends undertaking a comprehensive botanical inventory of the entire area within the property's boundaries, in order to map all vegetation communities within the property's boundaries. The vegetation communities should be classified as per the "Ecological Land Classification for Southern Ontario" system, to either the "Ecosite" or "Vegetation Type" level, depending on the habitat specificity of potential SAR on the property.

II. Potential SAR on the property

A list of species at risk that have the potential to occur on the property can be produced by cross- referencing the Vegetation Types described during the botanical inventory with the habitat descriptions of species at risk known to occur in the county or regional municipality within which the property is located. A list of species at risk known and suspected to occur in the single tier municipality of Hamilton is attached. The species-specific COSEWIC status reports (www.cosewic.gc.ca) are a good source of information on species at risk habitat needs and will be helpful in determining the suitability of the property's Vegetation Types for a given species.

III. SAR surveys

The District is of the opinion that each species at risk identified under Step II should be surveyed for, regardless of whether or not the species has been previously recorded on the property. The survey report should describe how each species at risk was surveyed, and provide a rationale for why, if any, certain species appearing on the county/ regional municipal list were not the subject of the survey (e.g. No surveys for Wavy-rayed Lampmussel were conducted because there are no flowing watercourses within the property boundaries).

APPENDIX I:

North-South Environmental Incorporated Review of Bobolink Habitat

Introduction

In 2003 the City of Hamilton proposed Official Plan Amendments to incorporate additional lands within the Urban Area of Stoney Creek. The lands subject to these Official Plan Amendments became known as the Stoney Creek Urban Boundary Expansion (SCUBE) lands. The establishment of the Greenbelt Plan and several subsequent OMB hearings reduced the extent of the urban boundary expansion as originally proposed – in the end four disjunct blocks of land were incorporated in the Stoney Creek Urban Area. These blocks of land are referred to as SCUBE West, SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B).

The City of Hamilton is currently undergoing a planning process to prepare the Fruitland-Winona Secondary Plan to cover these four blocks of land. The SCUBE East Subwatershed Study, being completed by Aquafor Beech Limited, addresses the SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B) blocks as well as lands upstream and downstream.

North-South Environmental was retained by Aquafor Beech Limited in spring of 2010 to conduct breeding bird surveys within the study area of the SCUBE East Subwatershed Study, with a particular focus on the lands of SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B). During these surveys, Bobolink was observed. This species is considered Threatened in Canada by the Committee on the Status of Species at Risk in Ontario (COSEWIC) and in Ontario by the Committee on the Status of Species at Risk in Ontario (COSSARO). Bobolink was noted in two areas: three singing males were noted in SCUBE Central and four singing males were noted in Zone C. These should be considered “possible” breeding records, as there was no other breeding evidence noted, but the birds were exhibiting behaviour consistent with nesting so there is no reason to assume they were not nesting. It should be noted that there may be other locations for Bobolink within the study area of the SCUBE East Subwatershed Study as most of the focus of breeding bird surveys was on SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B); surveys within the broader study area were conducted by sampling representative habitats only.

In March, 2011 North-South Environmental Incorporated was requested by Aquafor Beech Limited to provide guidance for habitat conservation for Bobolink within the study area of the SCUBE East Subwatershed Study. This guidance is intended to address the requirements of the Endangered Species Act (2007). Several approaches are explored here, including the potential to build upon the Natural Heritage System (NHS) developed through the SCUBE East Subwatershed Study to include habitat for Bobolink.

MNR is currently drafting habitat specific regulations for protection of Bobolink habitat under the Endangered Species Act (2007). The habitat protection recommended in this study is predicated on the requirement to protect Bobolink habitat under the generic regulations. Once specific habitat regulations are provided they should be reviewed and the recommendations presented here revised as required to reflect the specific requirements.

Methods

North-South Environmental Incorporated reviewed a variety of literature sources, particularly the COSEWIC report for Bobolink (COSEWIC 2010 to determine the habitat requirements, as well as primary limiting factors and threats for Bobolink. Literature consulted is listed in the References section.

North-South Environmental Incorporated also consulted various agency staff including Joe Nocera, a research scientist in Species at Risk and Conservation Biology and grassland bird species specialist with the MNR, Karine Beriault, the Biodiversity and Species at Risk Biologist for the MNR Niagara Area office, Donald Sutherland, Zoologist with the Natural Heritage Information Centre, Chris Risley, Bird and Mammal Species at Risk Specialist, MNR Peterborough and Mike Cadman, songbird biologist with Environment Canada's Canadian Wildlife Service. The author's personal experience through 22 years of breeding bird surveys in a variety of urban and wilderness habitats was also used throughout the study.

Bobolink Habitat Requirements

Grassland Requirements

In southern Ontario, Bobolink nest primarily within areas of forage crops for livestock, such as hayfields and lightly-grazed pastures (COSEWIC 2010) dominated by a variety of tall grass and herb species, such as clover (*Trifolium* spp.), Timothy (*Phleum pratense*), smooth brome (*Bromus inermis*) and orchard grass (*Dactylis glomerata*), and broadleaved plants such as goldenrods (*Solidago* spp.) (COSEWIC 2010; personal observation). Hayfields and lightly-grazed pastures are this species' preferred habitat due to the plant cover present at the start of the nesting season (Nocera et al., 2007); such cover is generally absent from grain fields. Bobolink prefer habitat with moderate to tall vegetation, moderate to dense vegetation and moderately deep litter (Dechant *et al.* 1999). Bobolink also occur in wet prairie, graminoid peatlands and abandoned fields dominated by tall grasses, remnants of uncultivated tall-grass prairie, no-till cropland, small-grain fields, reed beds and irrigated fields in arid regions (COSEWIC 2010). However, in Ontario, lower densities are present in tallgrass prairie than in non-native grasslands (Sutherland 2011, pers. comm.). In Ontario, this species is also found in alvar habitat (personal observation).

The Bobolink is also known to use sites that have been restored to grassland habitat (COSEWIC 2010). Throughout its range alfalfa (*Medicago sativa*) monocultures are variably occupied (COSEWIC 2010). In Ontario, alfalfa fields support much lower abundance of Bobolink than grass-dominated hayfields (Nocera 2011, pers. comm.; Cadman 2011 pers. comm.; personal observation). Bobolinks do not generally occupy fields of row crops, such as corn, soybean and wheat (COSEWIC 2010, Cadman, Nocera pers. comm., 2010; personal observation), pastures in valleys with high shrub density or intensively grazed pastures (COSEWIC 2010). In Ontario they can be found in fields with a light shrub cover, for example, Cadman (2011, pers. comm.) has noted them in fields where there is a shrub density of approximately 1 shrub/100 m^2 of grassland habitat. However, Nocera (2011, pers. comm.) noted that they are often not found in fields with even small numbers of shrubs.

Nocera (2011, pers. comm.) noted that Bobolink habitat in hayfields in Ontario tends to rotate between different crop systems. Over time, hayfields cannot continue to produce high yields if hay is removed year after year as the soils become depleted of nutrients and so these areas have a crop rotation pattern that includes tilled crops. Therefore, Bobolinks may not nest in the same field every year depending on the rotation, but will nest in nearby fields with suitable habitat in the area. In addition, Bobolink prefer grasslands with moderate thatch (Dechant ***et al***. 1999), so grasses must be removed or the thatch will become too thick. Therefore, fields that provide preferred habitat are generally tilled from time to time reducing thatch build up. Cover crops such as alfalfa and clover are planted with grass species to return nitrogen to the soil. Hayfields are also sometimes rotated with other crops, such as pure alfalfa and even row crops such as soybeans and corn (Nocera 2011 pers. comm., personal observation).

Area-Sensitivity

Bobolink is generally noted to be area-sensitive throughout its range, occurring mainly in large fields (over 50 ha in size; Herkert et al. 1994), but also nesting in smaller (e.g. as small as 5 ha) fields (Nocera 2011, pers. comm.) in open agricultural settings (Cadman, Nocera, 2011 pers. comm.; personal observation, COSEWIC 2010). As noted by O'Leary and Nyberg (2000): "Birds' view of the vegetation structure of the landscape at many scales probably determines where they choose to settle". Estimates of area-sensitivity for Bobolink are thus somewhat variable, as they depend on factors that include the size of individual fields, the management of fields over time and the regional setting where fields are located. In a study in Illinois, Bobolink rarely occurred in grassland fields of less than 20 ha (Herkert 1991 in Vickery et al. 1994) and this author considered 10-30 ha to be the species' minimum requirement. Herkert (1994) observed that the probability of observing this species reached 50% only in fields over 50 ha. Reproductive success is reportedly lower in small (16-32 ha) habitat fragments (Johnson and Temple 1990). Forman et al. (2002), in a study within an urbanizing agricultural landscape near Boston, noted that all regular breeding (breeding observed in three or more years) of Bobolink only occurred on grasslands greater than 7.2 ha.

Area-sensitivity is at least partly related to the fact that Bobolink avoid edges of woodlands, hedgerows, etc. Nesting success of Bobolinks and other grassland birds decreases near woodland edges (Bollinger and Gavin 2004). Bobolink do not utilize the edge as frequently as the interior area (O'Leary and Nyberg 2000). Fencerows that grassland birds avoid may be dispersal corridors for small mammals as well as foraging runways for nocturnal predators, such as raccoons, skunks and coyotes (O'Leary and Nyberg 2000). However, Renfrew et al. (2005) noted that high predation rates occurred on nests regardless of distance from edge in fragmented landscapes, probably because predators were abundant and could penetrate easily into grassland habitats.

Threats

Agricultural landscapes may become ecological sinks for Bobolink, especially in actively managed hayfields, if haying occurs early in the season.(Perlut et al. 2008). Bobolink eggs and post-fledging juveniles are particularly susceptible to early haying, with nest success declining drastically if haying occurs when eggs or post-fledging juveniles are present (COSEWIC 2010). In Ontario, Gahbauer (2007) has reported that nesting success is considerably higher in undisturbed fields and those mown in mid- to late summer, as early haying results in a high rate of juvenile mortality or nest failure. Bobolink tend to have high fidelity to nest sites: they return to the same nest site every year and so will continue to use the same habitat as long as nesting success is high (Gavin and Bollinger 1988).

Nests and newly-fledged young of grassland species are also highly susceptible to predation, particularly near woodland edges (Renfrew et al. 2005, Suedkamp Wells et al. 2007), but also at considerable distance from edges in fragmented landscapes (Renfrew et al. 2005). It is likely that newly-fledged juveniles are susceptible to vehicle collisions, like most juvenile birds (personal observation), where nests are located in close proximity to roads. Grassland bird nests are also somewhat susceptible to cowbird parasitism (Dechant *et al.* 1999).

Breeding habitat of Bobolink is generally threatened because of habitat loss, due to intensification of agriculture and succession of cultural meadows to shrubland. Suitable habitat used during migration and wintering habitat is also likely being lost, though less is known about this species' migration and wintering requirements. Bobolink has one of the longest migrations of any songbird species (approximately 20,000 km), which places this species at greater risk of encountering hazards on migration and/or on wintering grounds such as human harvest, poisoning (because they are considered pests) and habitat destruction (COSEWIC 2010).

Presence in Urban Habitat

Bobolink are not generally found in habitat surrounded by urban development (personal observation; Cadman, Nocera, and Sutherland, 2011 pers. comm.); for example, this species is not found in larger grasslands that occur in some urban settings such as hydro rights-of-way and roadside verges (personal observation; Sutherland and Cadman 2011, pers. comm.). However, as in the study area of the SCUBE East Subwatershed Study, this species is occasionally found in suitable grasslands in settings where there is a mix of agricultural fields and areas recently converted to urban and residential development (personal observation: for example in the City of Mississauga and Towns of Aurora and Stony Creek). However, it is not known where the threshold exists regarding sensitivity to development, i.e. how much development Bobolink will tolerate.

Almost no studies have investigated Bobolink habitat preferences in urban settings: almost all studies are in habitat in agricultural settings where the surrounding landscape is characterised by small woodlands, riparian areas and croplands. Jones and Bock (2002) studied Bobolink and other grassland species in municipal open space in Boulder, Colorado and concluded that municipal open spaces can support populations of many Great Plains grassland birds, including Bobolink, if habitat areas are of sufficient size. However, in this study Bobolink distribution was clumped, as the only suitable tall grass habitat for Bobolink was to the south-east of the City, and it is not clear whether Bobolink were found near urban development. In a study evaluating farmland habitat use by breeding birds in southern Quebec, Jobin et al. (1998) encountered no bobolinks in urban habitat – the highest incidence was in dairy farming areas, followed by cash crops, then old fields. This study concluded that Bobolink may avoid houses, based on the fact that only one bobolink was observed out of 86 stops in or near farm houses in this study.

Haire et al. (2000) concluded that urbanization imposed limits on the abundance of all grassland bird species in a Colorado study, (including bobolink), suggesting that urbanization operates at time scales too fast for evolutionary adjustment, and the effects of urbanization continue after the landscape has changed through pollution of air and water. These authors also suggested that interactions between species may also be affected by urbanization; urban cover-types provide opportunities for interspecific competition between grassland nesters and suburban nesting species that would not exist otherwise. In addition, ground-nesting songbirds are easy targets for domestic predators (cats and dogs) whose populations are not limited by availability of prey. As noted above, predators can penetrate a considerable distance into grasslands in fragmented landscapes. However, as in the study by Jones and Bock (2002), the limited extent of tallgrass cover type corresponded with the limited extent of species that depend on this cover type (Bobolink among them), and they were unable to draw conclusions strictly regarding effects of urbanization.

Bobolink appear to avoid busy roads. Breeding of Bobolink and other grassland birds decreases within 700 m of the edges of busy (i.e. more than 15,000 to 30,000 cars/day) roads (Forman et al, 2002). Bobolink are also likely highly susceptible to urban threats. They are ground nesters, and as noted above, nests and young are highly vulnerable to predation. They are low flyers and likely susceptible to vehicle collisions. In addition, they are susceptible to trampling; for example, they are not found in heavily used pastures.

Bobolink Conservation in the SCUBE East Subwatershed

Lands Subject to Fruitland-Winona Secondary Plan

North-South Environmental Incorporated assessed SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B) for potential Bobolink habitat. Within these lands, the area of most suitable Bobolink habitat consists of the portion of SCUBE Central east of Lewis Road, as it is the only area that includes a large block of grassland – all other large open areas are fragmented by fencerows, old orchards, patches of cultural woodland, etc... It is likely that this entire area would have to be protected to maintain Bobolink. This area supported three Bobolinks in 2010 (with the caveat that these are records of possible breeding only). The habitat for this species appeared suitable in 2010, with the area occupied mainly by hayfields, though with small areas of abandoned orchard, hedgerow and a small strip of ploughed cropland. The approximate area of optimal habitat within SCUBE Central east of Lewis Road is currently 10 ha. However, if the entire area (which is approximately 16 ha) were converted to grassland habitat, the area is within the lower end of the size range reported to provide preferred habitat for Bobolink. In addition, the area is currently in a regional landscape setting most often associated with the presence of Bobolink: the SCUBE Central lands are still in a largely open, agricultural setting, with localized areas of development.

However, there are many uncertainties associated with conservation of Bobolink habitat in this setting. The portion of the SCUBE Central lands east of Lewis Road is surrounded on two sides and partially on a third side with residential development along the road frontage. Since Bobolink are not generally found in urban settings, it is not certain whether this species would persist, if the remaining frontage areas along Highway 8 and Lewis Road develop in a similar fashion and/or if the SCUBE Central lands west of Lewis Road were developed, as this species appears to be sensitive to surrounding development. It is likely that the croplands located to the north and/or south of the area of optimal habitat would need to be preserved as agricultural or open space (Nocera 2011, pers. comm.). This would provide a more extensive grassland corridor north and south of the SCUBE Central lands that would encourage the persistence of grassland species (Nocera 2011, pers. comm.). However, lands north of Barton Street east of Lewis Road are currently being developed into an industrial park or are subject to planning applications to develop residential housing. Moreover, since the size of the habitat provided by the SCUBE Central lands east of Lewis Road may be near the threshold of Bobolink area requirements and may be degraded as urbanization proceeds, it could not be guaranteed that Bobolink would persist in the area all years, or at all (Nocera 2011, pers. comm., Cadman 2011, pers. comm., Sutherland 2011, pers. comm.).

In addition to protecting adjacent lands from urban development the conservation of Bobolink habitat in the SCUBE Central lands east of Lewis Road would also entail a considerable commitment to management to maintain suitable grassland habitat. For example, as trees and shrubs naturally develop in old fields or meadows they would have to be rigorously removed to ensure successional processes did not degrade Bobolink habitat. The habitat could be planted as permanent grassland, with sowing of warm season grasses, and managed as tallgrass prairie by annual mowing and prescribed burning. However, this may result in sub-optimal habitat, as in Ontario, abundance of Bobolink in tallgrass prairie is much lower than in forage crops (Sutherland 2011, pers. comm.). The preferred alternative would be to manage the area for hay with no early season cutting and with occasional crop rotation. In this case, there would be years when alfalfa or soybeans (for example) would be planted to replenish soil nutrients. The habitat would not be suitable for Bobolink during years when crops other than forage grasses were planted. In all cases, grasses would need to be removed from time to time to avoid build-up of too deep a thatch, as Bobolink prefer a moderate thatch cover.

In addition, development would have to be managed in the area surrounding the SCUBE Central lands east of Lewis Road such that this Bobolink habitat does not become completely surrounded by urban development. In particular, adjacent agricultural habitat to the north and/or south would need to be maintained. This is likely not possible for the lands north of Barton Street east of Lewis Road as they are currently being developed into an industrial park or are subject to planning applications to develop residential housing. Further, busy arterial roads (i.e. over 15,000 to 30,000 cars/day) should not be built within approximately 700 m of this species' habitat. Again, this would be difficult as Highway 8 is already an arterial road and traffic will likely increase as proposed urbanization of the lands subject to the Fruitland-Winona Secondary Plan proceeds. Control of urban predators such as cats and raccoons should be implemented, possibly with the use of a fence around the habitat. The habitat could be used as an area for passive recreation, as long as trails were routed away from nest sites (this species is not particularly sensitive to the presence of people) but dogs would have to be kept on a leash during the breeding season for these birds.

Zones A and C

North-South Environmental Incorporated also noted Bobolink in fields south of Highway 8, in the area east of Fifty Road north of the Niagara Escarpment. Bobolink may be more widespread than this study suggests as breeding bird surveys focused on SCUBE Central, SCUBE East (Parcel A) and SCUBE East (Parcel B); elsewhere within the study area of the SCUBE East Subwatershed Study only representative habitat was sampled. The habitat between the Escarpment and Highway 8 is generally very open, and any suitable grassland area is likely to provide suitable habitat for Bobolink. Bobolink will likely persist as long as the farming practices in this area continue to provide grassland habitat. However, in this part of Ontario hayfields are generally cut prior to the fledging of young (some hayfields had already been cut by the time of the second field visit, on June 12th 2010, in this study). It is likely that mortality of eggs and post-fledging young due to the practice of early cutting of hay is similar to that reported in other areas of Ontario. Thus, it is unknown whether the hayfields in this area would be source or sink habitats for Bobolink. In addition, farming practices in this area may change in the future, with potential loss of hay fields to other types of agriculture, reducing the available habitat for Bobolink. However, these areas of potential habitat are not likely to be subject to intensive urban development as the area south of Highway 8 is subject to the Niagara Escarpment Plan.

Conclusions and Recommendations

Bobolink was noted in two areas within the study area of the SCUBE East Subwatershed Study; within the portion of the SCUBE Central lands east of Lewis Road and within the agricultural lands south of Highway 8. The presence of Bobolink is related to hayfields that provide suitable grassland habitat but within the study area of the SCUBE East Subwatershed Study areas of suitable habitat may be near the threshold of the size preferred by Bobolink, a species which is highly area-sensitive. The presence of Bobolink is likely related to the open agricultural setting in which hayfields are located.

It is recommended that two management strategies be employed to protect habitat for this species:

1. Designate the entire portion of the SCUBE Central lands east of Lewis Road as an Area Specific Policy Area pending MNR development of Endangered Species Act (2007) regulations for the protection of Bobolink habitat; and

2. Promote agricultural practices that support Bobolink habitat in Zone C.

Should the hayfields in the SCUBE Central lands east of Lewis Road be included in the specific habitat regulations (as seems likely), the entire area east of Lewis Road would be protected. At such time when the specific regulation is drafted for Bobolink habitat, and when the Recovery Strategy is provided, policies for management of this area should be developed.

This two-pronged strategy would provide the most certainty that habitat can be maintained and enhanced. However, the habitat within the SCUBE Central lands may be near the threshold of this area-sensitive species' size range in urban settings, and the habitat will become less suitable as the surrounding landscape becomes developed, such that the species may not persist even if the habitat is maintained and appropriately managed. Fields must be managed to control shrubs and trees, to reduce thatch build-up and also to ensure that the soil nutrients are not depleted by continuous removal of hay. This will likely entail occasional use of the area for other crops such as soybeans or alfalfa which are not suitable habitat for Bobolink. Management of the surrounding lands would also have to include control of development so that the grassland does not become surrounded by urban uses, as well as control of road development as Bobolink abundance decreases within 700 m of a busy highway. Such control may be difficult to accomplish as the lands north of SCUBE Central east of Lewis Road are currently being developed into an industrial park or are subject to planning applications to develop residential housing. Moreover, Highway 8 is already an arterial road. In addition, a fence should be erected around the area to protect it from urban predators. The preserve could be used as recreational open space, and during parts of the year even as an off-leash dog park, but dogs would have to be on-leash during the breeding season.

In order to increase the certainty that Bobolinks persist in the SCUBE East Subwatershed, it is recommended that continued management of the agricultural area south of Highway 8 and east of Fifty Road for hay be promoted through stewardship initiatives. However, late haying practices should be promoted.

APPENDIX J:

Preliminary Meander Belt Assessment

Aquafor Beech Limited determined a preliminary meander belt width for each watercourse within Zone B of the SCUBE Subwatershed Study. Quantification of the meander belt was intended to be a first approximation and thus did not consist of a thorough and detailed assessment. Instead, the empirical relation provided by TRCA (2001) was used to quantify the meander belt. This equation was developed for watercourses within the TRCA jurisdiction and is based on sound physical predictors of meander belt widths, which include slope, discharge, and drainage area. The equation is based on a data set of rural watercourses which had not been previously altered, had no recent change in hydrologic regime, had drainage areas < 25 km^2 and were not situated on bedrock.

Data used to calculate the meander belts for Zone B (e.g. drainage area and estimates of future flows) were obtained from elsewhere in the Stage 1 and Stage 2 Report. Data pertaining to channel slope were derived from City of Hamilton digital mapping. The empirical equation presented in TRCA (2001) provides approaches for taking into account changes in hydrologic regime and thus this was used for the current study since not only peak flows would change, but also flow duration and frequencies. Results of the preliminary meander belt assessment are provided below.

Site	Preliminary meander belt width (m)
WC 5.0 Future	42
WC 5.2 Future	16
WC 6 - Future	44
WC 7 West - Future	41
WC 7 East - Future	42
WC 7 Center - Future	55
WC 7.2 - Future	17

Typically, when undertaking meander belt assessments, multiple approaches are used to converge upon a single meander belt value. Thus, caution should be used when applying the above value for future land planning decisions and a thorough meander belt assessment should be undertaken for each watercourse.

1.0 Introduction

Stantec was retained by the City of Hamilton in 2012 to conduct avian Species at Risk (SAR) surveys and Breeding Bird Surveys within the Fruitland-Winona Secondary Plan Area (hereafter SPA) and the Scube Central, Scube East ‘A’ and Scube East ‘B’ parcels (hereafter Scube Parcels). The SPA and Scube Parcels are located in the east portion of the City of Hamilton and are generally bounded to the north by the Queen Elizabeth Way, to the west by Fruitland Road, to the south by Highway 8 and to the east by Fifty Road. A portion of the Scube East Parcel B extends easterly from Fifty Road approximately 1 kilometre so as to contain the channel of 50 Creek and additional lands east of the channel. The location of these parcels is shown in Figure 1.

SAR surveys were conducted for Bobolink (*Dolichonyx oryzivorus*), Eastern Meadowlark (*Sturnella magna*), Barn Swallow (*Hirundo rustica*) and Chimney Swift (*Chaetura pelagica*) as these species were considered to potentially occur and breed in the SPA and Scube Parcels (Karine Beriault, MNR Guelph District SAR Biologist). Each of these provincially threatened species typically nest and forage in human-altered habitats throughout much of eastern North America, including areas with a mix of rural and urban land use such as occur within the SPA and Scube Parcels. The Bobolink, Eastern Meadowlark and Barn Swallow typically nest and forage in agricultural habitats while Chimney Swift nests and forages over urban areas.

The purpose of these surveys was to determine whether particular avian SAR occur within the SPA and Scube Parcels and, to identify locations where avian SAR occur. Based on our findings, we were to make recommendations regarding areas, if any, which should be preserved for these avian SAR. General Breeding Bird Surveys were also conducted to identify breeding bird species within the SPA and Scube Parcels, whether SAR or non-SAR species. Findings of these surveys will be used to guide land use planning as part of the Fruitland-Winona Secondary Plan. Work performed was based on the Scope of Work provided by the City of Hamilton on April 3rd, 2012 and June 25th, 2012.

This report includes:

- Findings of avian SAR Surveys
- Maps of avian SAR Locations
- An evaluation of the habitat types in the study area in terms of their potential use by the following SAR: Bobolink, Eastern Meadowlark, Barn Swallow, and Chimney Swift;
- Recommendations regarding any potential areas for preservation of avian SAR habitat;
- Findings of Breeding Bird Surveys; and
- Field data sheets.

DRAFT

Title

Study Area

2.0 Current Land Use

The SPA and Scube Parcels have historically been rural areas where farming was the dominant land use. In the SPA, wheat is still farmed to the west of Jones Road and remnant fruit trees and vineyards are occasionally present throughout the remainder of the SPA. In the Scube Parcels, farming still occurs on the east side of Lewis Road.

An examination of aerial imagery reveals that buildings within the SPA and Scube Central Parcel are common and highly concentrated along roadways; fallow land and limited active agricultural land lies in the interiors of parcels. The majority of buildings present are residences, but business and municipal buildings also occur. In the Scube East 'A' and Scube East 'B' parcels, fallow land occupies almost all of the parcels and buildings are only rarely present along roadways.

In addition to widespread fallow land, the SPA and Scube Parcels include small woodlands, shrub thickets and wetlands. All forms of natural habitat within the SPA and Scube Parcels are small in area, fragmented and in pioneering or early stages of vegetation succession.

3.0 Methods

SAR Surveys for Chimney Swift, Barn Swallow, Eastern Meadowlark and Bobolink were carried out in the SPA and Scube Parcels using protocols recommended by the MNR and Bird Studies Canada when these had been developed; and, protocols of the Ontario Breeding Bird Atlas (OBBA) when specialized protocols do not exist.

Surveys for non-SAR birds were carried out in the SPA and Scube Parcels using protocols of the OBBA.

Survey methods for both SAR and non-SAR birds are described below.

3.1 CHIMNEY SWIFT

Chimney Swift is known to depend almost entirely on chimneys for nesting and roosting within southern Ontario. Therefore, assessment for this species focused on examining the suitability of chimneys for nesting and roosting using the Chimney Swift Monitoring Protocol (Bird Studies Canada, 2009) as well as making Chimney Swift observations.

The Chimney Swift Monitoring Protocol assesses the suitability of chimneys for Chimney Swift roosting/nesting based on their physical dimensions and the presence/absence of features which prevent Chimney Swifts from entering and leaving chimneys such as animal guards, spark protectors, terra cotta liners and metal liners. As buildings with potentially suitable chimneys were found within the Study Area only along the existing roadways, surveys consisted of stopping at 200 m intervals along all roadways where buildings occurred and determining the suitability of chimneys at these locations for Chimney Swift nesting and roosting. At each survey location, chimneys were observed for 15 minutes to allow opportunity to detect any Chimney Swifts using the chimney. Surveys for Chimney Swift were conducted throughout daylight hours as this species remains active throughout the day.

Using the 200 m intervals, and given the length of roadways present, 27 locations were surveyed within the SPA and 13 locations were surveyed within the Scube parcels. The lower number of locations within the Scube parcels is due to the lack of buildings in Scube East 'A' and Scube East 'B' parcels. Locations where chimneys were assessed for their suitability for Chimney Swift nesting are shown In Figure 2.

Chimney Swift surveys were conducted within the SPA on May 17th and 31st, 2012. Additional observations within the SPA were made June 25th, 2012 at two locations where Chimney Swift were encountered on May 31st. Surveys within the Scube Parcels occurred on June 26th, July 4th and July 12th, 2012.

In addition to the dedicated Chimney Swift survey, any Chimney Swifts encountered in all other surveys conducted including SAR Surveys for Barn Swallow, Bobolink and Eastern Meadowlark and surveys for non-SAR birds were also recorded.

3.2 BARN SWALLOW

No MNR-sanctioned survey method for Barn Swallows exists. Recognizing that it is standard practice in avian surveys to identify and record all species of birds heard or seen, it was decided to assess Barn Swallows simultaneously with other species during standard OBBA point counts. These point counts are of five minute duration and are conducted during early morning hours (5 AM to 10 AM) when bird activity is at a maximum.

Point count locations were chosen before fieldwork commenced through consideration of habitat as characterized by Aquafor Beech (2012). Locations were chosen to provide the best possible access to all habitats found within the study area. Selection of point count locations had to accommodate limited property access within the SPA and restriction to road ROWs within the Scube Parcels. The survey locations selected for Barn Swallows were considered to adequately cover available habitat since Barn Swallows are aerial foragers and are highly mobile and easily detectable. To increase the probability of detection, monitoring occurred 3 times spaced through the nesting season.

Seventeen point count locations were chosen within both the SPA and Scube Parcels (Figure 3). Point counts within the SPA included locations both on and off roadways. Point counts within the Scube Parcels were limited to road ROWs. Surveys at the point count locations took place on June 11th/12th, June 25th and July 10th 2012 within the SPA and on June 26th, July 4th and July 12th, 2012 within the Scube Parcels.

Barn Swallow nests were searched for under bridges spanning watercourses within the SPA and Scube Parcels because Barn Swallows often nest on the exposed beams of older bridges (Cadman et al. 2007). Aerial imagery and background documents identify that small watercourses cross under several roadways within the SPA and Scube Parcels including Barton, Highway 8, Fruitland Road and Glover Road in the SPA and the South Service Road in the Scube Parcels. Searches for Barn Swallow nests occurred at all locations where roads crossed watercourses.

Surveys for Barn Swallow nests took place at 7 watercourse locations within the SPA (Figure 3). These surveys took place on June 11th/12th, June 25th and July 10th 2012 within the SPA. Surveys for Barn Swallow nests took place at 2 watercourse locations within the Scube Parcels (Figure 3). Surveys within the Scube Parcels occurred on June 26th, July 4th and July 12th, 2012. Surveys for Barn Swallow nests took place throughout the day as any nests present would be visible at any time of the day.

Any incidental observations of Barn Swallows made during Chimney Swift, Bobolink and Eastern Meadowlark surveys were also recorded.

3.3 EASTERN MEADOWLARK

Surveys for Eastern Meadowlark used 10 minute point counts in areas of apparently suitable habitat as identified through prior studies (Aquafor Beech, 2012) and aerial imagery. The 10 minute period is suggested by the MNR and is probably sufficient given the species frequent and distinctive vocalizations and conspicuousness in the open habitats it frequents.

Areas of apparently suitable habitat for Eastern Meadowlark consist of forb meadow, fresh – moist mixed meadow habitats and other open habitats. Point count locations were selected within the SPA and Scube Parcels before fieldwork commenced, in areas where access had been granted and habitat appeared suitable. To improve probability of detection, monitoring occurred 3 times spaced through the nesting season.

Surveys within the SPA took place at 10 locations on June 11th/12th, June 25th and July 10th, 2012. An initial reconnaissance of the Scube Parcels for Eastern Meadowlark habitat found habitat to be limited such that only 1 location of apparently suitable habitat was selected for surveys. Surveys within the Scube Parcels occurred on June 26th, July 4th and July 12th, 2012. Because access to properties was not obtained for the Scube Parcels, this survey took place along the roadway adjacent to suitable habitat. Eastern Meadowlark survey locations are shown on Figure 4.

During general Breeding Bird Surveys and all other surveys, any additional Eastern Meadowlark sightings were recorded.

3.4 BOBOLINK

Bobolink was searched for simultaneously with Eastern Meadowlark at the same locations and dates. Therefore, surveys within the SPA took place at 10 locations on June 11th/12th, June 25th and July 10th, 2012 and within the Scube Parcels at 1 location on June 26th, July 4th and July 12th, 2012. Bobolink survey locations are shown on Figure 4.

During general Breeding Bird Surveys and all other surveys, any additional Bobolink sightings were recorded.

3.5 COMMON SPECIES

Surveys of non-SAR birds were conducted within the SPA and Scube Parcels using 5 minute point counts during which all species of birds heard or seen are identified and recorded. This 5 minute period is the standard recommended in the OBBA (Cadman et al. 2007). Surveys were conducted during early morning hours (5 AM to 10 AM) when bird activity is at a maximum.

Point count locations were chosen before fieldwork commenced through consideration of habitat as characterized by Aquafor Beech (2012). Locations were selected to to provide the best possible access to all habitats found within the study area. Selection of point count locations had to accommodate limited property access within the SPA and restriction to road ROWs within the Scube Parcels. This restriction on point count locations likely affected detection of some species within the Scube Parcels.

To improve probability of detection, monitoring occurred 3 times spaced through the nesting season. Seventeen point count locations were chosen within both the SPA and Scube Parcels (Figure 5). Point counts within the SPA included locations both on and off roadways. Point counts within the Scube Parcels were limited to road ROWs. Surveys at the point count locations took place on June 11th/12th, June 25th and July 10th 2012 within the SPA and on June 26th, July 4th and July 12th, 2012 within the Scube Parcels.

Any avian SAR observed during these surveys were recorded and are mapped and considered in this report.

4.0 Considerations for Species at Risk

This section presents relevant information on the biology of Chimney Swift, Barn Swallow, Eastern Meadowlark and Bobolink, evidence that declines have occurred in Ontario's populations and factors thought to be involved in their declines.

Evidence of declines is based primarily on the Ontario Breeding Bird Atlas (OBBA) and Breeding Bird Survey (BBS) as these two projects provide the most comprehensive information on Ontario's bird populations. The OBBA was conducted from 1981 to 1985 (Cadman et al.

1987) and again from 2001 to 2005 (Cadman et al. 2007), with over 121,000 hours and 152,000 hours of observations conducted in the first and second atlases respectively. The BBS has been conducted annually since 1966 across North America and Ontario and over 300 surveys have been conducted within Ontario (Sauer et al. 2011).

Factors thought to be involved in declines are those discussed in relevant COSEWIC and COSSARO reports.

4.1 CHIMNEY SWIFT

Chimney Swift can be thought of as having two components to its habitat: chimneys within which nesting, roosting and reproduction occur and air masses within which foraging takes place. Chimney Swift nest sites have been afforded general habitat protection through the ESA (MNR 2008).

Chimney Swift is an aerial forager of flying insects; a group or guild of bird species that includes swallows, martins, flycatchers, goatsuckers and others . Aerial foragers have experienced widespread population declines since about the 1980's and these declines are suspected to be due, in part, to declining populations of flying insects (McCracken 2008). According to the BBS, the Canadian Chimney Swift population declined 7.8% annually between 1968 and 2005, resulting in a cumulative decline of 95% over that 37-year period (COSEWIC 2007). Similarly, data from the OBBA estimates that the probability of Chimney Swift detection declined by 46% in Ontario between 1981-1985 and 2001-2005. Data from the United States indicates that the species is declining there as well (COSEWIC 2007).

Chimney Swifts are believed to have declined only in part due to drops in flying insect populations. Major losses of nest and roost sites may be a more significant problem. Chimney Swifts are almost entirely dependent upon chimneys for nesting and roosting. Suitable chimneys are larger than 28.5 cm in diameter, offer protection against cold weather and include a rough inner surface of brick, cement, or tile permitting the attachment of nests. . Suitable chimneys also must be freely accessible to Chimney Swifts (Bird Studies Canada, 2009). In recent decades, older chimneys have been modified to improve safety by the addition of spark protectors, animal guards, metal liners and caps. These modifications inadvertently made chimneys inaccessible to Chimney Swifts (COSSARO, 2009; COSEWIC 2007). As well, since about 1960, homes have generally been built with chimneys too small for use by Chimney Swift.

As the dramatic reduction in suitable nesting and roosting sites appears to be a principal cause for declining populations of Chimney Swift, any effort to protect the species would need to focus on protecting remaining nest and roost sites.

4.2 BARN SWALLOW

Like the Chimney Swift, Barn Swallow habitat can be considered to consist of a nest site and foraging habitat. Nests are almost always built on human structures that provide a horizontal nesting surface such as barns, sheds, garages, bridges with exposed beams and road culverts.

Barns have historically been important breeding sites for Barn Swallow and unlike garages, shed and other structures where nest sites are more limited, barns typically support larger colonies of Barn Swallow (COSEWIC 2011a). Barn Swallows forage for flying insects over a variety of relatively open areas such as pastures, fallow land, and farmland of various descriptions, wetlands, road rights-of-way, large forest clearings, cottage areas, islands, sand dunes and lakeshores (COSEWIC 2011a).

Like Chimney Swift, Barn Swallows are aerial foragers and have experienced widespread population declines both within Ontario and across much of North America (COSSARO 2011a). The declines in Barn Swallow populations are likely due in part to reductions in flying insect populations (McCracken 2008). In Canada, long-term BBS data show a statistically significant decline of 3.6% per year between 1970 and 2009, which corresponds to an overall population decline of about 76% over the last 40 years (COSEWIC 2011a). In Ontario, the probability of detection for Barn Swallow declined by 35% between the first and second OBBA (Cadman et al. 2007).

Despite these declines, Barn Swallows remain quite widespread and common in southern Ontario (Cadman *et al.* 2007; COSEWIC 2011a). While it may seem contradictory that a species can be both "at risk" and relatively common and widespread, SAR classification within Ontario considers population trends and threats to a species as well as its current abundance and distribution. For Barn Swallow, classification as a provincially threatened species was made because the population decline is over the threshold level of 30% over the most recent 10-year period (COSSARO 2011a).

While declining populations of flying insects are likely partly responsible for declines in Barn Swallow populations, declines in the number of nest sites may also be involved as older-style wooden farm structures with easy access to nest sites are gradually replaced by modern buildings that lack easy access to suitable nesting sites (COSEWIC 2011a, COSSARO 2011a). Other factors responsible for declining populations are the replacement of grassland and pastures with row crops and urban land uses, use of pesticides, reduction in the fecundity of Barn Swallows and other factors (COSEWIC, 2011a).

4.3 EASTERN MEADOWLARK

The Eastern Meadowlark is most common in native grasslands, pastures and savannahs. It also uses other anthropogenic grassland habitats including hayfields, weedy meadows and grassy airfields. Eastern Meadowlarks occasionally nest in row crop fields such as corn and soybean, but these crops are considered low-quality habitat. Large tracts of grasslands are preferred over smaller fragments: the *Significant Wildlife Habitat Technical Guide* (MNR, 2000) states that 10 ha of suitable habitat are necessary for Eastern Meadowlark breeding. Vegetation structure is also important. Generally, optimal habitat contains moderately tall (25 to 50 cm) grass with abundant litter cover, a high proportion of grass, moderate to high forb density and low shrub and tree cover.

The Eastern Meadowlark is one of a number of grassland species which have shown widespread population declines (McCracken 2005). The Eastern Meadowlark has shown significant declines in Ontario and Canada. Long-term BBS data show a statistically significant population decline of 3.1% per year in Canada between 1970 and 2009, which corresponds to an overall decline of 71% over 40 years (Sauer et al. 2011). The OBBA shows a similar decline with Eastern Meadowlark detected 13% less frequently in Ontario and 16% less frequently in the Carolinian zone in the second Atlas compared to the first 20 years earlier.

Several factors appear to be involved in the species’ declining populations. Habitat loss appears to be a primary factor as grasslands and pastures at the edges of urban areas or in marginal farming areas are abandoned and succeed to forest or shrub-dominated areas. Habitat is also lost when grasslands and pastures are converted to row crops or urban land uses. Other factors that may be involved in declining populations include: changes in farming practices, particularly earlier and more frequent haying that appears to significantly reduce nestling and adult survival; pesticide use; predation; Brown-headed Cowbird parasitism; climate change; and overgrazing by livestock (COSEWIC 2011b; COSSARO 2011b).

4.4 BOBOLINK

The Bobolink nests primarily in forage crops (e.g., hayfields and pastures), abandoned fields dominated by tall grasses and small-grain fields (COSEWIC 2010). In Ontario it was probably originally rare, but its range expanded with the arrival of Europeans and the conversion of forests to forage crops. The Bobolink is sensitive to habitat size; the MNR (2000) suggests that habitat should be at least 50 ha in size to support breeding.

Like Eastern Meadowlark, Bobolink is a grassland species. The Bobolink has significantly declined in Canada and Ontario. In Canada, long-term BBS data show a significant decline of 5.2% per year between 1968 and 2008, which corresponds to a population loss of 88% over the last 40 years (COSEWIC 2010). In Ontario, the OBBA showed a statistically significant decline in the probability of detection of 28% in Ontario and of 10% within the Carolinian zone between 1981-1985 and 2001-2005.

Changing farming practices and habitat loss appear to be the major factors involved in population declines. Haying is occurring earlier in the summer and frequently occurs before Bobolinks fledge. When fields with active nests are cut, mortality of young is 94% (COSEWIC 2010). The conversion of hayfields and pastures to row crops has also played a part in population declines as row crops are rarely used for nesting. Pastures have declined by 35% to 70% between 1981 and 2001 in different regions of Ontario (Cadman et al. 2007). Bobolink breeding habitat has also been lost as farmland near cities have been converted to urban land uses, and abandoned farmland has succeeded to forested or shrub-dominated habitat. Pesticide use on both breeding and wintering grounds, habitat fragmentation, overgrazing by livestock and climate change are also considered potential contributors to population declines (COSEWIC 2010; COSSARO 2010).

5.0 Results

The following reports findings of 2012 surveys for SAR based on all survey types and for non-SAR based on general Breeding Bird Surveys. All data sheets used to record observations are provided in Appendix C.

5.1 CHIMNEY SWIFT

Fruitland-Winona SPA

A significant effort was made to detect Chimney Swift and Chimney Swift accessible chimneys in the SPA. Surveys of chimneys took place at 27 locations on May 17th and 31st, 2012. Additional opportunity to detect Chimney Swifts occurred while conducting non-SAR bird surveys. Such surveys took place at 17 locations throughout the SPA on June 11th/12th, June 25th and July 10th, 2012. The total time spent searching for Chimney Swift within the SPA was approximately 30 hours.

Despite this considerable search effort, Chimney Swift was recorded at only 3 locations within the SPA. Birds observed appeared to be foraging only, flying well above chimneys present, making no effort to enter chimneys and flying over an extensive area. As Chimney Swifts are aerial foragers which fly for much of the day and wander widely from nest and roost sites, the limited observations suggest that the observed swifts nest and roost outside of the SPA but occasionally forage in the air mass above the SPA. Locations where Chimney Swift was encountered were in the vicinity of Highway 8 and are shown in Figure 6.

During surveys of chimneys, chimneys at 27 properties were assessed for suitability based on their dimensions and the presence or absence of safety features such as animal guards, spark protectors, metal liners, and terra cotta liners. At all chimneys examined, it was observed that chimneys were unsuitable for nesting or roosting due to various types of modifications to chimneys which prevent swifts from entering.

Based on the unsuitability of chimneys, the limited number of Chimney Swift sightings and the behaviour of those swifts observed, Chimney Swifts do not appear to nest or roost within the SPA.

Scube Parcels

A significant effort was also made to detect Chimney Swift and Chimney Swift accessible chimneys in the Scube parcels. Surveys of chimneys took place on June 26th, July 4th and 12th, 2012 using the Chimney Swift Monitoring Protocol at 13 locations. As with the SPA, additional opportunity to detect Chimney Swifts occurred while conducting non-SAR bird surveys which took place on June 26th, July 4th and July 12th, 2012 at 17 locations. Despite a search effort of approximately 10 hours during dedicated Chimney Swift surveys and an additional time of approximately 15 hours during general breeding bird surveys, Chimney Swift was not recorded within any of the Scube parcels during any component of fieldwork (Figure 6).

Chimneys were assessed for suitability for Chimney Swift nesting and roosting on June 26th, July 4th and 12th, 2012 using the Chimney Swift Monitoring Protocol at 13 locations. No chimneys were found which appeared suitable for use by Chimney Swift. Only Scube Central had a significant number of buildings with chimneys, but these chimneys all had modifications such as animal guards and metal liners which prevent Chimney Swift from entering the chimney. Chimneys were found to be almost entirely lacking in the Scube East 'A' and Scube East 'B' parcels due to buildings being only rarely present.

Based on the lack of Chimney Swift sightings and the unsuitability of chimneys, Chimney Swifts do not appear to nest or roost within the Scube Parcels.

5.2 BARN SWALLOW

Fruitland-Winona SPA

Barn Swallows are common and widespread within the SPA. They were observed at 17 locations and were encountered on surveys conducted May 17th and 31st, June 11th, 12th and 25th and July 10th, 2012. Birds were encountered on general Breeding Bird Surveys, Bobolink and Eastern Meadowlark surveys and Chimney Swift surveys. Surprisingly, no Barn Swallows or Barn Swallow nests were encountered at the seven watercourse crossing locations. Overall, the species was encountered with such frequency that it was one of the most widespread species in the SPA (Table 1). The locations of observed birds are shown in Figure 7. The abundance of Barn Swallow within the SPA may seem at odds with its status as a provincially threatened SAR but its provincial status is based on declining numbers (COSSARO 2011a) rather than rarity and our results are in accord with results of the second OBBA which showed it to be present in almost all parts of southern Ontario (Cadman et al. 2007).

Birds were observed to preferentially forage over cultural meadows, abandoned farmland, agricultural fields and mown lawns. These habitats are all herbaceous-dominated and consistent with descriptions of foraging habitat provided in COSEWIC (2011a). Field investigations and aerial photography show such herbaceous-dominated areas to dominate the majority of the SPA and the ubiquity of this type of habitat likely accounts for the abundance of the species within the SPA. When observed, Barn Swallows were found in small numbers (<10) rather than large concentrations.

During fieldwork it was observed that apparently suitable nest sites for Barn Swallow such as sheds and garages were common within the SPA. While these structures were not counted they may number several hundred. These apparently suitable structures are for the most part associated with private residences which are common along all roadways and not within the interior of land parcels. Field investigations also determined that barns which could support larger Barn Swallow colonies were not present within the SPA. Therefore it is expected that sheds, garages and other structures associated with private residences are the most frequently used and important structures for Barn Swallow nesting. Observations which would suggest nesting in these structures such as birds entering/leaving buildings were limited but did occur. Unlike barns which can support larger colonies (COSEWIC 2011a), individual sheds and garages within the SPA likely typically support only one or two pairs due to their relatively limited space.

Barn Swallow nests were specifically searched for at 7 locations where roadways within the SPA crossed watercourses (Figure 2). This specific effort was made because Barn Swallows frequently nest on the exposed horizontal beams that support many bridges. Barn Swallow nests were not observed at any of the 7 watercourse crossings and watercourses were found to be spanned by box culverts or corrugated steel pipes rather than bridges. The box culverts and corrugated steel pipes which span watercourses within the SPA do not provide Barn Swallow nesting opportunities due to the lack of horizontal structures upon which swallows could build nests, their relatively small height and width (1 to 2 metres) and the presence of vegetation at the ends of culverts which appears likely to obstruct Barn Swallows from entering.

Scube Parcels

Barn Swallows are common and widespread within the Scube parcels. They were observed at 14 locations within the Scube parcels distributed across all Scube Parcels. Barn Swallows were observed on surveys conducted June 26th, July 4th and July 12th, 2012 both during general Breeding Bird and dedicated Chimney Swift surveys. The locations of observed birds are shown in Figure 7 and the relevant data sheets are provided in Appendix B.

Birds observed were foraging over cultural meadows, abandoned farmland and mown lawns. Field investigations and aerial photography show such areas to dominate the majority of the Scube Parcels and the ubiquity of this type of habitat likely accounts for the abundance of the species within the Scube Parcels. When observed, Barn Swallows were found in small numbers (<10) rather than large concentrations.

Field investigations determined that apparently suitable nest sites such as sheds and garages were common within the Scube Central parcel and concentrated along existing roadways and not within the interior of land parcels. Scube East Parcel 'A' and Scube East Parcel 'B' had very limited number of garages, sheds and other potential nest sites within them. Field investigations also determined that barns which often support larger colonies in Ontario were not present within the Scube parcels.

Watercourse crossings which have the potential to allow Barn Swallow nesting under bridges were limited to a crossing of a creek along the South Service Road to the east of Fifty Road. No Barn Swallows or their nests were observed at this watercourse (Appendix B). Field investigations determined that this watercourse is spanned by a relatively large box culvert which does not provide nesting opportunities due to the lack of ledges upon which swallows could build nests, and the presence of vegetation at the ends of culverts which appeared to obstruct entrance to the culverts.

5.3 EASTERN MEADOWLARK

Fruitland-Winona SPA

A significant effort was made to detect Eastern Meadowlark in the SPA. Dedicated Eastern Meadowlark surveys took place at 10 locations with suitable habitat located throughout the SPA on June 11th/12th, June 25th and July 10th, 2012. General breeding bird surveys which can also detect Eastern Meadowlark took place at an additional 7 locations on June 11th/12th, June 25th and July 10th, 2012. The total time spent searching for Eastern Meadowlark within the SPA was approximately 15 hours.

Despite this significant search effort, Eastern Meadowlarks were not observed within the SPA during surveys dedicated to this species or during other fieldwork (Figure 8). The lack of observations occurred despite the conspicuous nature of the species and the observers' prior experience with the species. When present, the Eastern Meadowlark is easily detected as its breeding songs and calls are distinctive and its frequent flights above grasslands are conspicuous. The absence of sightings during our 2012 investigations provides good evidence that no Eastern Meadowlark breeding occurred this year within the SPA.

Habitat within the SPA appears unsuitable for Eastern Meadowlarks for two reasons. First, grassland habitats within the SPA are relatively small compared to the 10 ha value cited in the *Significant Wildlife Habitat Technical Guide* (MNR, 2000). Second, herbaceous vegetation appears to be denser, higher and composed of a high frequency of forbs relative to grasses compared to optimal habitat preferred by Eastern Meadowlarks (Zimmerman 1992; Bollinger 1995). Optimal habitat for Eastern Meadowlark is considered to consist of sparse, short, patchily-distributed, grass-dominated vegetation. Third, shrubs and tree saplings appear to be too frequent within abandoned farmland for Eastern Meadowlark. Shrub and tree cover values of 5% are considered optimal for Eastern Meadowlark habitat (COSEWIC 2011b) but shrub and tree cover within the SPA appeared to significantly exceed this value. As the shrub and tree saplings already present will likely increase in density and height, the suitability of the land for breeding by Eastern Meadowlark will only decrease in the future.

Scube Parcels

Search effort for Eastern Meadowlark within the Scube Parcels was considerable with searches occurring at 17 locations on June 26th, July 4th and July 12th, 2012. Despite a search effort of approximately 15 hours within the Scube parcels, Eastern Meadowlarks were detected at only three locations within the Scube parcels, all in the vicinity of Lewis Road (Figure 8). Birds were encountered at these sites only on the initial survey (June 26th) and appeared to be absent on subsequent surveys (July 4th and 12th) at the same locations. Due to its frequent vocalizations, Eastern Meadowlark is a fairly conspicuous species and the lack of sightings on July 4th and 12th suggests the species may have abandoned the sites between the first and subsequent surveys.

Habitat within the Scube parcels was compared to optimal Eastern Meadowlark habitat as described in COSEWIC (2011b**)** and the *Significant Wildlife Habitat Technical Guide* (MNR, 2000). To be suitable for occupancy, grassland habitat must be 10 ha or larger (MNR 2000). However, within the Scube parcels, hedgerows, shrubs and treed areas are frequent and appear to fragment grassland habitat into areas less than 10 ha in size. Second, optimal shrub and tree cover is considered to be 5% for Eastern Meadowlark (COSEWIC 2011b) but shrub and tree cover within herbaceous-dominated areas appears to exceed this value. Due to insufficient sizes and excessive woody cover, habitat for Eastern Meadowlark appears to be marginal within the Scube parcels.

5.4 BOBOLINK

Fruitland-Winona SPA

Despite three surveys conducted specifically to detect Bobolink at 10 point count locations and an additional three surveys conducted for breeding birds in general at 17 point count locations, Bobolinks were observed in only one part of the SPA. These sightings occurred between Fruitland and Jones Roads where a mixed meadow several hectares in size exists (Figure 8). During the June 11th, 2012 survey, 4 male and 1 female Bobolink were observed in a mixed meadow. Two males appeared agitated by the observer's presence and the female appeared paired with one of the males. These observations suggest that at this date, Bobolinks were attempting to breed within the area. During the second and third surveys conducted June 25th and July 10th, 2012, no Bobolinks were observed in the same area. Their absence at these later dates suggests the birds had abandoned the mixed meadow as it is unlikely that birds would have successfully bred and then dispersed from the area by these dates.

The area Bobolinks were observed within had earlier been identified as a fresh-moist mixed meadow (Aquafor Beech, 2012). Habitat within this area was compared to optimal Bobolink habitat as described in COSEWIC (2010) and the *Significant Wildlife Habitat Technical Manual* (MNR 2000). Optimal Bobolink habitat has a low frequency of shrub and tree cover within the dominant herbaceous vegetation (COSEWIC 2010). While conducting fieldwork, it was observed that the mixed meadow had inclusions of old hedgerows and stands of trees and shrubs and that the number of new saplings and shrubs was high, making the area unsuitable as Bobolink habitat. Further evidence of the unsuitability of the area for Bobolink is based on the area occupied. The *Significant Wildlife Habitat Technical Manual* states that 50 ha or more of habitat is required for occupancy by Bobolink. Within the SPA, the area occupied by Bobolink was estimated by creating a polygon from observation locations and determining the enclosed area. This area was determined by be 7 ha, far below the 50 ha value cited in the *Technical Manual*.

During the July 10th, 2012 survey, 2 male and one female/juvenile Bobolinks overflew the area. Based on their behaviour, these birds appeared to be post-breeding individuals moving through the area. Fall migration of this species begins in mid-to-late July, with adults and immature birds forming loose flocks close to the breeding grounds (COSEWIC, 2010).

Scube Parcels

Despite a search effort of approximately 15 hours which included three surveys for breeding birds in general at 17 locations and three surveys specifically for Bobolink at one location, no evidence that Bobolink breed within the Scube parcels was obtained. During surveys conducted June 26th and July 4th, Bobolink was not observed at any locations despite the conspicuous nature of this species with its frequent singing and flights over open grasslands. The absence of sightings provides good evidence that Bobolinks do not breed within the Scube Parcels.

On the July 12th survey, Bobolink was observed at one location (Figure 8). At this location, three Bobolinks were observed to overfly the area, moving in an easterly direction without stopping. Fall migration of this species begins in mid-to-late July, with adults and immature birds forming loose flocks close to the breeding grounds (COSEWIC, 2010). The three individuals observed overflying the Scube parcels were judged to be post-breeding birds engaged in this behavior.

As with the SPA, habitat within the Scube parcels was compared to optimal Bobolink habitat as described in COSEWIC (2010) and the *Significant Wildlife Habitat Technical Manual* (MNR 2000). Optimal Bobolink habitat has a low frequency of shrub and tree cover within the dominant herbaceous vegetation (COSEWIC 2010). While conducting fieldwork, it was observed that no land was being farmed and that fallow land was a mix of herbaceous meadows, thickets and early succession forest. As with the SPA, herbaceous dominated areas appeared to include a frequency of shrubs and saplings sufficiently high that these areas would be unsuitable for Bobolink. As well, no area of herbaceous-dominated vegetation was near in size to the 50 ha value cited in The *Significant Wildlife Habitat Technical Manual* (MNR 2000). It was also noted during fieldwork that some portions of the Scube parcels are being developed for residences.

Our observations that much of the Scube parcels are succeeding to tree and shrub-dominated communities or are being developed for residences, coupled with the lack of breeding evidence, strongly suggests that the Scube parcels lack breeding Bobolink and that the species will continue to be absent from the area.

5.5 COMMON NIGHTHAWK

Common Nighthawk (*Chordeiles minor*) has been designated as a species of Special Concern on the SARO list and when observed is often within urban areas (Cadman et al. 2007). Surveys for this species were not included within the work plan but one individual was observed during the Chimney Swift chimney assessment carried out May 31st. The individual observed was flying about 100 m above the ground in an erratic manner and appeared to be foraging in the way characteristic of its species. No behavior was observed which would suggest nesting. As a species of special concern, the Common Nighthawk and its habitat are not protected through the ESA (2007).

5.6 COMMON SPECIES

The following section reports findings of 2012 general Breeding Bird Surveys with respect to all species of breeding birds including SAR. SAR results are discussed in more detail in Sections 5.1 through 5.5.

Fruitland-Winona SPA

A total of 44 species were encountered within the SPA. These species are listed in Table 1 (Appendix B) from the most frequently encountered to least frequently encountered species. Of the 44 species encountered, 26 are considered to be common and widespread within Ontario (S5 rank), 14 are considered uncommon but not rare within Ontario (S4 rank) and 2 species are not native to Ontario.

Species observed are adaptive to a wide variety of habitat and capable of using small, fragmented areas of suitable habitat. Examples of such species include American Robin (*Turdus migratorius*), Song Sparrow (*Melospiza melodia*), Northern Cardinal (*Cardinalis cardinalis*), American Goldfinch (*Carduelis tristis*) and Brown-headed Cowbird (*Molothrus ater*). Each of these species was encountered at 10 or more locations within the SPA. Due to their abundance and widespread distributions within Ontario, these species are not considered of conservation concern. The provincially threatened Barn Swallow was also widespread (10 locations) and is discussed in Section 5.2.

The least frequent species were 11 species encountered at only 1 location. These species were Red-tailed Hawk, (*Buteo jamaicensis*), American Kestrel (*Falco sparverius*), American Woodcock (*Scolopax minor*), Black-billed Cuckoo (*Coccyzus erythropthalmus*), Downy Woodpecker (*Picoides pubescens*), Northern Flicker (*Colaptes auratus*), Alder Flycatcher (*Empidonax alnorum*), Warbling Vireo (*Vireo gilvus*), White-breasted Nuthatch (*Sitta carolinensis*), Brown Thrasher (*Toxostoma rufum*) and Swamp Sparrow (*Melospiza georgiana*). Although these species were only infrequently found within the SPA, they are still relatively common species within Ontario with wide distributions (S4 and S5 species) and are not of conservation concern.

Within the SPA, most species encountered have relatively stable populations. Thirty of 44 species encountered did not show any statistically significant change in numbers between the two OBBAs in the Carolinian zone (Table 1). Relatively stable species include most of the more widespread species such as Northern Cardinal, Song Sparrow, Gray Catbird and Brown-headed Cowbird and the Barn Swallow, which was reported as stable in the Carolinian zone, even though this species was reported as showing statistically significant declines in the province as a whole based on the OBBA work.

Statistically significant declines over the OBBA periods were reported in 11 of the 44 species encountered (Table 1). Declining species included four aerial insectivores, five grassland/shrub species, one wetland and one forest species.

Declines in aerial insectivores are possibly due to declines in aerial insects, pesticides use both on breeding grounds and wintering areas, loss of habitat and for Chimney Swift, loss of nesting and roosting sites (North American Bird Conservation Initiative Canada. 2012; Nebel *et al.* 2010). Declining aerial insectivores encountered within the SPA were Chimney Swift, Northern Rough-winged Swallow, Common Nighthawk and Eastern Kingbird.

Grassland and shrub dwelling species have shown widespread declines in much of North America (North American Bird Conservation Initiative Canada. 2012). The decline in grassland/shrub species appears to be due to: the loss of habitat as grasslands/shrub habitat is replaced by urban development near urban areas or reforested on marginal farmland; as pastures are replaced by row crops and hedgerows are removed; and through increases in pesticide and herbicide use (North American Bird Conservation Initiative Canada. 2012). Declining grassland/shrub species detected consisted of Field Sparrow, Bobolink, American Kestrel, Brown Thrasher and Eastern Kingbird, which is also considered a member of the aerial insectivores.

The wetland species encountered within the SPA which has shown declines within the Carolinian zone is the American Woodcock while the forest-dwelling species is the Northern Flicker.

Three species encountered within the SPA have had statistically significant population increases within the Carolinian zone; these species are House Finch, Cooper's Hawk and Black-capped Chickadee. The House Finch has shown a large population increase between 1981/85 and 2001/05. During this time period the species colonized southern Ontario after being introduced in New York state (Cadman et al. 2007). Cooper's Hawk has also increased greatly after adapting to urban landscapes (BirdLife International (2012). The Black-capped Chickadee population increase is much smaller but still statistically significant. Population increases are possibly due to an increase in the amount of forest habitat (North American Bird Conservation Initiative Canada. 2012).

Scube Parcels

A total of 45 species were encountered within the Scube parcels and these are listed in Table 2 (Appendix B) from the most frequently encountered to least frequently encountered species. Of species encountered, 24 are considered to be common and widespread within Ontario (S5 rank), 18 species are considered uncommon but not rare within Ontario (S4 rank) and 3 species are not native to Ontario.

As with the SPA, species were adaptive to a wide variety of habitat and capable of using small, fragmented areas of suitable habitat. The most widespread species were largely the same as within the SPA: American Robin, Northern Cardinal, Red-winged Blackbird (*Agelaius phoeniceus*), American Goldfinch, Song Sparrow and Brown-headed Cowbird were all encountered at 15 or more locations. These species are not considered of conservation concern.

The least frequently encountered species were 7 species encountered at 1 location: American Kestrel, Downy Woodpecker, Eastern Phoebe (*Sayornis phoebe*), Purple Martin (Progne subis), White-breasted Nuthatch (*Sitta carolinensis*), Indigo Bunting (*Passerina cyanea*) and Purple Finch (*Carpodacus purpureus*).

Barn Swallow, Eastern Meadowlark and Bobolink, all of which are provincially threatened, were all encountered within the Scube parcels. The Barn Swallow was observed at 14 locations (Figure 4) while the Eastern Meadowlark and Bobolink were observed at 3 and 1 locations respectively. These SAR are discussed in Sections 5.2 through 5.5.

The comparison of birds encountered in the Scube parcels and the list of increasing, decreasing and relatively stable species, based on the two OBBAs, yielded results similar to the SPA area. Of the 45 species encountered, 27 have shown relatively stable populations within the larger Carolinian zone between 1981/85 and 2001/05 (Table 2). Relatively stable species again include most of the species which are widespread in the Scube Parcels such as American Robin, Red-winged Blackbird, Mourning Dove, Song Sparrow and the Barn Swallow although this species has shown statistically significant declines in the province as a whole.

Statistically significant (<0.1) declines have occurred in 12 of the 45 species encountered within the Scube parcels (Table 1). Declining species included three aerial insectivores, six grassland/shrub species and three forest species. Declining aerial insectivores encountered within the Scube parcels were Northern Rough-winged Swallow, Eastern Kingbird and Purple Martin. Declines in aerial insectivores are possibly due to declines in aerial insects, pesticides use both on breeding grounds and wintering areas and loss of habitat (North American Bird Conservation Initiative Canada. 2012; Nebel *et al.* 2010).

Grassland/shrub species encountered within the Scube parcels which have declined significantly in the Carolinian zone are Eastern Meadowlark, Field Sparrow, Bobolink, Brown Thrasher, American Kestrel and Eastern Kingbird which is a shrub-dwelling species as well as an aerial insectivore.

Forest-dwelling species encountered within the Scube parcels which have declined significantly in the Carolinian zone are Northern Flicker, Indigo Bunting and Purple Finch.

One additional declining species was encountered whose habitat is difficult to categorize. This species, the Killdeer, typically forages and nests on lawns and bare soil.

6.0 Discussion

The following section evaluates habitat in the SPA and Scube Parcels in terms of their potential use by Bobolink, Eastern Meadowlark, Barn Swallow, Chimney Swift and common species. No areas are recommended for preservation for these species due to small or non-existent populations, poor quality habitat which appears to be further declining in value as breeding habitat, and for Barn Swallows, the lack of concentrated breeding or foraging areas.

6.1 CHIMNEY SWIFT

Fruitland-Winona SPA

No areas within the SPA are recommended for preservation as a means of preserving the provincially threatened Chimney Swift..

The primary reason for not protecting any portion of the SPA for Chimney Swift populations is that the species appears to be limited to occasional foraging within the air mass above the SPA. Nesting appears to occur somewhere outside of the SPA.

Secondly, it was observed that chimneys in the SPA were unsuitable for nesting or roosting by this species due to modifications to chimneys which increase safety but prevented Chimney Swift from entering.

Scube Parcels

No areas within the Scube Parcels are recommended for preservation as a means of preserving the provincially threatened Chimney Swift. The rationale for this conclusion is as follows.

Based on our 2012 surveys, the Chimney Swift does not appear to occur within the Scube Parcels (Figure 6).

Secondly, it was observed that chimneys in the Scube Parcels were unsuitable for nesting or roosting by this species due to the absence of chimneys in the Scube East ‘A’ and Scube East ‘B’ parcels, and the modifications to chimneys which had occurred in the Scube Central parcel.

6.2 BARN SWALLOW

Fruitland-Winona SPA

No areas within the SPA are recommended for preservation as a means of preserving the provincially threatened Barn Swallow. This conclusion is based on the lack of concentrated foraging and nesting areas for Barn Swallows. The absence of areas where Barn Swallows nest or forage in large numbers means that protecting specific areas would be ineffective in protecting a large proportion of birds currently present. In addition, because Barn Swallow populations appear to be falling in part due to declining numbers of flying insects, and because numbers of flying insects are expected to continue to fall (McCracken, 2008), retention of specific nest sites and/or foraging areas is not likely to prevent Barn Swallow numbers from falling within the SPA.

Scube Parcels

No areas within the Scube Parcels are recommended for preservation as a means of preserving the provincially threatened Barn Swallow. This conclusion is based on the lack of concentrated foraging and nesting areas for Barn Swallows. The absence of areas where Barn Swallows nest or forage in large numbers means that protecting specific areas would be ineffective in protecting a large proportion of birds currently present. In addition, because Barn Swallow populations appear to be falling in part due to declining numbers of flying insects, and because numbers of flying insects are expected to continue to fall (McCracken, 2008), retention of specific nest sites and/or foraging areas is not likely to prevent Barn Swallow numbers from falling within the Scube Parcels.

6.3 EASTERN MEADOWLARK

Fruitland-Winona SPA

No areas within the SPA are recommended for preservation as a means of preserving the provincially threatened Eastern Meadowlark.

The principal reason for not protecting land for Eastern Meadowlark within the SPA is that the species already appears to be absent. This conclusion is based on the findings of our 2012 surveys which did not detect Eastern Meadowlark within any part of the SPA (Figure 8).

A second reason for not protecting land for Eastern Meadowlark populations within the SPA is that habitat within the SPA appears to be unsuitable for Eastern Meadowlarks due to the insufficient size of grasslands present and excessive amounts of shrub and tree cover within grassland areas.

Succession of fallow land within the SPA from herbaceous-dominated to shrub and tree-dominated communities is widespread and has made the SPA unsuitable for Eastern Meadowlark breeding. This same process of succession is also occurring within marginal farmland across much of Ontario and North America and causing declining populations in these much larger areas (COSSARO 2011b).

Scube Parcels

No areas within the Scube Parcels are recommended for preservation as a means of preserving the provincially threatened Eastern Meadowlark.

The primary reason for not protecting land for Eastern Meadowlark populations within the Scube Parcels is that populations are small. This conclusion is based on our 2012 surveys which found only three individuals during approximately 15 hours of field investigations.

A second reason for not protecting land for Eastern Meadowlark populations within the Scube Parcels is that habitat within the Scube parcels appears to be unsuitable for Eastern Meadowlarks due to insufficient size and excessive woody cover.

The reforestation of fallow land within the Scube Parcels is reducing the suitability of habitat for Eastern Meadowlark. This same process is also occurring within marginal farmland across much of Ontario and North America and causing declining populations in these much larger areas (COSSARO 2011b).

6.4 BOBOLINK

Fruitland-Winona SPA

No areas within the SPA are recommended for preservation as a means of preserving the provincially threatened Bobolink.

The first reason for not protecting land for Bobolink populations within the SPA is that the Bobolink population is already small and likely declining.

The second reason for not protecting land for Bobolink populations within the SPA is that Bobolink habitat within the SPA is of marginal and decreasing value to Bobolinks due to insufficient area and the high frequency of shrub and sapling growth. Within several years, this growth in the amount of woody vegetation will likely result in the disappearance of Bobolink as a breeding species from the SPA.

The succession of abandoned farmland from herbaceous-dominated to shrub and tree-dominated communities which is occurring within the SPA is an example of the larger scale succession of abandoned farmland across Ontario and much of North America which is considered to be a major factor in the species’ decline within Ontario and much of North America (COSSARO 2010).

Scube Parcels

No areas within the Scube Parcels are recommended for preservation as a means of preserving the provincially threatened Bobolink..

The first reason for not protecting land for Bobolink populations within the Scube Parcels is that a breeding population within these parcels already appears to be absent. This conclusion is based on the findings of our 2012 surveys

The second reason for not protecting land for Bobolink populations within the Scube Parcels is that habitat within the Scube parcels already appears to be unsuitable for Bobolinks due to the insufficient size of habitats and the high and increasing frequency of shrub and tree cover.

6.5 COMMON SPECIES

Fruitland-Winona SPA

Forty-four species of birds were encountered within the SPA and these included four Species at Risk (Chimney Swift, Barn Swallow, Common Nighthawk and Bobolink) (Table 1). Most species encountered likely breed within the SPA and are common, widespread species within Ontario (S5), are uncommon but not rare within Ontario (S4) or are non-native species to Ontario (SNA). The majority of species are widespread because they commonly nest and forage in small and fragmented areas of suitable habitat such as occurs within the studied areas.

No portions of the SPA are recommended for preservation to protect common bird species found within them. This is because most common species present have stable numbers, are widespread within Ontario and adaptive to human development to the extent that that they will continue to occur in developed areas, using planted trees and shrubs for nesting. Examples of such species include American Robin, Chipping Sparrow and American Goldfinch. Additional common species found within the SPA are declining in the larger Carolinian zone but preservation of habitat for these species within the SPA is not recommended due to the ineffectiveness of habitat protection in a small portion of these species' ranges to reverse declining populations at much larger scales. For example, Field Sparrow, Eastern Kingbird, Northern Rough-winged Swallow and American Woodcock are all declining in the Carolinian zone, but protecting the limited habitat for these species found within the SPA will not effectively reverse population declines throughout the Carolinian zone. Other species which currently occur such as Willow Flycatcher, Savannah Sparrow and Northern Flicker are expected to disappear from the SPA as a result of development, but their expected disappearance is not considered sufficient cause to preserve the area as they are widespread within Ontario and not considered to be of conservation concern. Area-sensitive species of forest, grassland and wetland are often of conservation concern in areas with extensive development such as occurs within the SPA and Scube Parcels because suitable large areas of forest, grassland and wetland are infrequent in such areas. Within the SPA, 3 of 44 species found (Bobolink, Cooper's Hawk and White-breasted Nuthatch) are considered to be area-sensitive species. Based on the fragmented nature of habitat within the SPA, it cannot be considered important habitat for area-sensitive species.

Scube Parcels

Forty-five species of birds were encountered within the Scube Parcels including three Species at Risk (Barn Swallow, Bobolink and Eastern Meadowlark) (Table 2). All species encountered likely breed within the Scube Parcels and are common, widespread species within Ontario (S5), are uncommon but not rare within Ontario (S4) or are non-native species to Ontario (SNA). The majority of species are widespread because they commonly nest and forage in small and fragmented areas of suitable habitat such as occurs within the studied areas.

No portions of the Scube Parcels are recommended for preservation to protect common bird species found within them. This is because most species present are common and widespread within Ontario and are adaptive to human development such that many will continue to occur in developed areas, using planted trees and shrubs for nesting. As with the SPA, additional common species found within the Scube Parcels are declining in the larger Carolinian zone but preservation of habitat for these species within the Scube parcels is not recommended due to the ineffectiveness of habitat protection in a small portion of these species' ranges to reverse declining populations at much larger scales. For example, Field Sparrow, Eastern Kingbird, Northern Rough-winged Swallow and American Woodcock are all declining in the Carolinian zone, but protecting habitat for these species within the Scube parcels will not effectively reverse population declines throughout the Carolinian zone. With development, some species are expected to disappear such as Willow Flycatcher, Gray Catbird and Savannah Sparrow however these species are not considered to be of conservation concern. Area-sensitive species of forest, grassland and wetland were limited to 3 of 45 species (Bobolink, Eastern Meadowlark and White-breasted Nuthatch) detected within the Scube Parcels. Based on the fragmented nature of habitat within the Scube Parcels, it cannot be considered important habitat for area-sensitive species.

Table 2: Breeding Bird Species within Scube Central, Scube East Parcel 'A' and Scube East Parcel 'B'.

Common Name	*Scientific Name*	*Habitat Preference*	*Total # of Stations per Species*	*Ontario Status*	COSSARO	COSEWIC	Population Changes Between Atlases	Area Sensitivity (ha)	Local Status Hamilton
Purple Martin	*Progne subis*	Aerial forager	1	S4B			-21		Uncommon
White-breasted Nuthatch	*Sitta carolinensis*	Forest	1	S5			NS	10	
Indigo Bunting	*Passerina cyanea*	Forest	1	S4B			-14		
Purple Finch	*Carpodacus purpureus*	Forest	1	S4B			-36		Uncommon

COSSARO: Committee on the Status of Species at Risk in Ontario

COSEWIC: Committee on the Status of Endangered Wildlife in Canada

S4: Apparently Secure—Uncommon but not rare

S5: Secure—Common, widespread, and abundant in the province

SNA: Not applicable—A conservation status rank is not applicable because the species is not a suitable target for conservation activities.

END: Endangered

THR: Threatened

NS: Not Statistically Significant

Barn Swallow Observation Form

Project Number: 60950443
Project Name: Hamilton
Date: June 12, 2012
Field Personnel: N. Kopysh

Weather Conditions:	Temp: 20°C.	Wind: 3	Cloud: 100%	PPT:	PPT in last 24 hrs: rain overnight

Station #13.

Location of BARS observation: ~~Ø~~

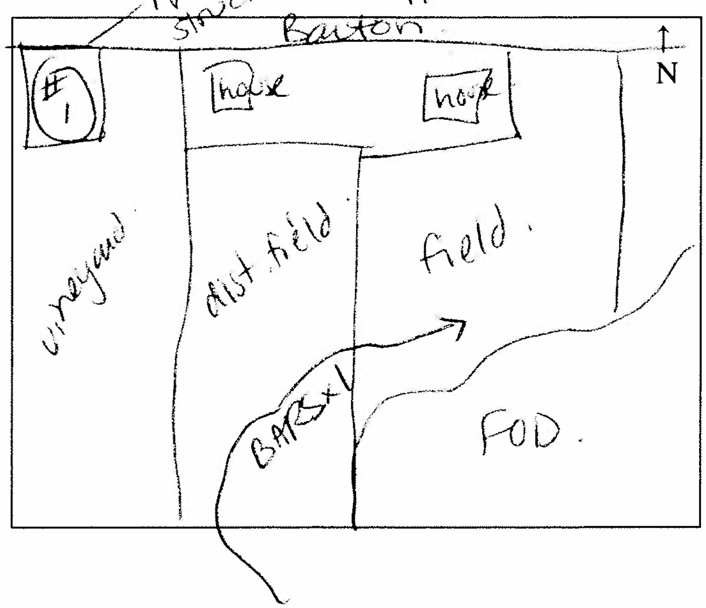
Start Time: 06:30 End Time: 06:45

Tally of BARS: ~~Ø~~ 1

Sketch of Habitat (include foraging habitat and location of potential nesting structures) or provide details on air photo

- Map crop types in vicinity of BARS observation and surrounding area (i.e. within 200m)
- Include location of water bodies (e.g. river, pond)
- Mark location of BARS foraging
- Mark location of potential nesting structures

potential nesting structure - old barn/sml shed - window covered with mesh



Description of Potential Nesting Structures:

Structure # (indicate location on map)	Type of structure (e.g. barn, culvert)	Accessible nesting sites (Y or N)	Number of nests present: BARS Active	BARS Inactive	CLIS Active	CLIS Inactive
#1	barn/shed.	open windows =	unknown - no	access		
		covered with	to observe			
		mesh				
		Y - front =	Ø	BARS seen		

open doorway. entering/exiting
1 seen in vicinity foraging

Chimney Code: H-748-1

GPS coordinates (DD.dddd):

Lat. 111 ° N

Long. 297 ° W

Number of years active (if known):

NOTE: Chimney codes are created using the following scheme:

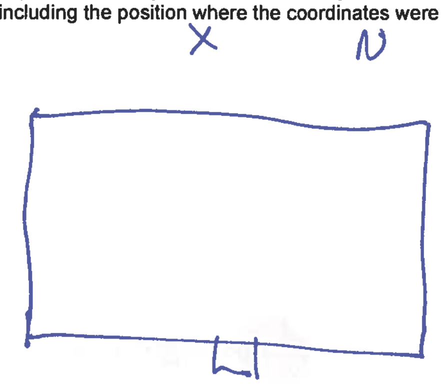
City Initials - Site Initials - Chimney Number

Eg.	City Name	Site Name	No. of Chimneys	Code
	Port Rowan	Public Library	1	PR-PL-1
	London	141 Wortley	2	LO-141-1
				LO-141-2

Chimney material (please check one):

- [x] Brick
- [ ] Stucco
- [ ] Concrete
- [ ] Stone
- [ ] Other, please specify: ______

If possible, please draw a picture of the chimney location on the building, including the position where the coordinates were taken.



If the chimney is modified (cap, liner, etc.), please check the appropriate modification:

- [ ] Cap
- [x] Terra Cotta Liner
- [ ] Animal Guard
- [x] Spark Protector
- [ ] Metal Liner
- [ ] Other, please specify: ______

Surrounding habitat (please check one):

- [x] Residential
- [ ] Industrial
- [ ] Commercial
- [ ] Natural
- [ ] Other, please specify: ______

Please select the **SHAPE** of your chimney and provide the appropriate estimated measurements:

- [ ] Round → Diameter (cm): ______
- [ ] Square → Width (cm): ______
- [x] Rectangular → Width (cm): 60 Length (cm): 2V

NOTE: Measurements can sometimes be estimated by counting bricks. Standard bricks have the following measurements: **20cm x 9cm x 6cm (L x W x H)**

Chimney Assessment Form

- [ ] Other, please specify: ______

If possible, please draw a picture of the chimney location on the building, including the position where the coordinates were taken.

If the chimney is modified (cap, liner, etc.), please check the appropriate modification:

- [ ] Cap
- [x] Terra Cotta Liner
- [ ] Animal Guard
- [ ] Spark Protector
- [ ] Metal Liner
- [ ] Other, please specify: ______

Surrounding habitat (please check one):

- [x] Residential rural
- [ ] Industrial
- [ ] Commercial
- [ ] Natural
- [ ] Other, please specify: ______

Please select the **SHAPE** of your chimney and provide the appropriate estimated measurements:

- [ ] Round → Diameter (cm): ______
- [x] Square → Width (cm): 40cm
- [ ] Rectangular → Width (cm): ______ Length (cm): ______

NOTE: Measurements can sometimes be estimated by counting bricks. Standard bricks have the following measurements: **20cm x 9cm x 6cm (L x W x H)**

Chimney Assessment Form

Page 2

Chimney height above roofline (m): 2	Number of Flues: 1	Colour of Chimney: Gray

Total Chimney Height (m) = 2 (Number of stories in building) × 3 m (approx height of one story) + 2 (Height above roofline (m)) = 8 m

If swifts are present, are they: ☐ **Nesting** ☐ **Roosting** ☐ **Unknown**

Additional Comments: None seen.

BASW seen in area. Potential nest sites in area.

Chimney Details

Site Name: 287 Jones

Chimney Code: H-287

NOTE: Chimney codes are created using the following scheme:

City Initials - Site Initials - Chimney Number

Eg.	City Name	Site Name	No. of Chimneys	Code
	Port Rowan	Public Library	1	PR-PL-1
	London	141 Wortley	2	LO-141-1
				LO-141-2

GPS coordinates (DD.dddd):

Lat. 4785965 ° N

Long. 606379 ° W

Number of years active (if known):

Chimney material (please check one):

- [ ] Brick
- [ ] Stucco
- [x] Concrete
- [ ] Stone
- [ ] Other, please specify: ______________________

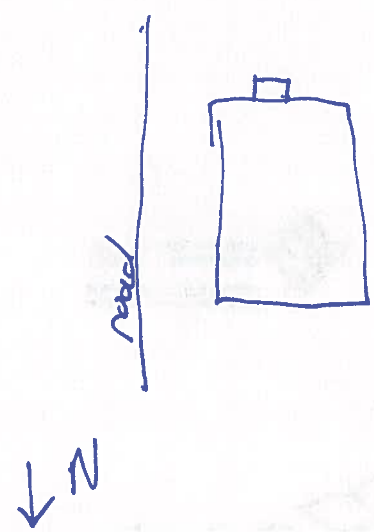
If the chimney is modified (cap, liner, etc.), please check the appropriate modification:

- [x] Cap
- [ ] Terra Cotta Liner
- [ ] Animal Guard
- [ ] Spark Protector
- [ ] Metal Liner
- [ ] Other, please specify: ______________________

Surrounding habitat (please check one):

- [x] Residential / Rural
- [ ] Industrial
- [ ] Commercial
- [ ] Natural
- [ ] Other, please specify: ______________________

If possible, please draw a picture of the chimney location on the building, including the position where the coordinates were taken.



Please select the **SHAPE** of your chimney and provide the appropriate estimated measurements:

- [ ] Round → Diameter (cm): ______
- [x] Square → Width (cm): 50
- [ ] Rectangular → Width (cm): ______ Length (cm): ______

NOTE: Measurements can sometimes be estimated by counting bricks. Standard bricks have the following measurements: **20cm x 9cm x 6cm (L x W x H)**

Chimney Assessment Form

Page 2

Chimney height above roofline (m): 1	Number of Flues: 1	Colour of Chimney: Gray

Total Chimney Height (m) = 1 (Number of stories in building) × 3 m (approx height of one story) + 1 (Height above roofline (m)) = 4 m

If swifts are present, are they: ☐ Nesting ☐ Roosting ☐ Unknown

Easting + Northing recorded on 2nd sheet

Additional Comments:
No chimneys suitable for chimney swift roosting or nesting were observed at the following 27 sites during a reconnaissance survey conducted May 2012. This additional survey conducted to provide evidence that Chimney Swift is absent as a nesting or roosting species in the Fruitland-Winona Secondary Plan Area

May 31st Daytime Chimney Swift Survey

Comments

Site 2: AMKE, a declining grassland species observed overflying site.

Site 14: 2 CHSW aerial foraging over site. Birds made no effort to fly into chimney of this or adjacent properties. Chimneys of subject property & adjacent properties appeared unsuitable for species based on criteria contained in the CHSW Monitoring Protocol.

Site 15: As at site 14, only differing in 4 CHSW aerial foraging

Chimney Assessment Form

Scube

Page 1

July 12, 2012 10:45 AM

Observer Details

Name D. Graham	Phone Number ( )	Email Address	
Street Address	City	Prov.	Postal Code

Building Details

Street Address 24 Victoria	City Winona	Prov. On.	Postal Code
Owner Name	Phone Number ( )	Email Address	

Type of building (please check one):

- [x] House
- [ ] Church
- [ ] Store
- [ ] Lowrise Apartment
- [ ] School
- [ ] Factory
- [ ] Highrise Apartment
- [ ] Hospital
- [ ] Other, please specify: ______

Chimney Details

Site Name
1

Chimney Code
SC - W1

GPS coordinates (DD.dddd):

Lat. 4785637 ° N

Long. 609801 ° W

NOTE: Chimney codes are created using the following scheme:

City Initials - Site Initials - Chimney Number

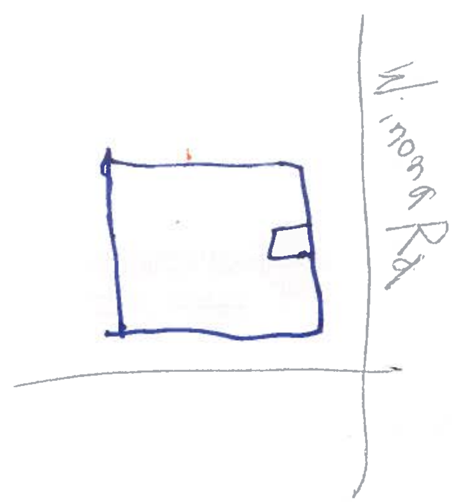
Eg.	City Name	Site Name	No. of Chimneys	Code
	Port Rowan	Public Library	1	PR-PL-1
	London	141 Wortley	2	LO-141-1
				LO-141-2

Number of years active (if known):

Chimney material (please check one):

- [x] Brick
- [ ] Stucco
- [ ] Concrete
- [ ] Stone
- [ ] Other, please specify: ______

If possible, please draw a picture of the chimney location on the building, including the position where the coordinates were taken.



If the chimney is modified (cap, liner, etc.), please check the appropriate modification:

- [ ] Cap
- [ ] Terra Cotta Liner
- [ ] Animal Guard
- [ ] Spark Protector
- [x] Metal Liner
- [ ] Other, please specify: ______

Surrounding habitat (please check one):

- [ ] Residential
- [ ] Industrial
- [ ] Commercial
- [ ] Natural
- [x] Other, please specify: Rural

Please select the **SHAPE** of your chimney and provide the appropriate estimated measurements:

- [ ] Round → Diameter (cm): ______
- [x] Square → Width (cm): ______
- [ ] Rectangular → Width (cm): 40 Length (cm): 40

NOTE: Measurements can sometimes be estimated by counting bricks. Standard bricks have the following measurements: **20cm x 9cm x 6cm (L x W x H)**

Chimney Assessment Form

Page 2

Chimney height above roofline (m): 2m	Number of Flues: 1	Colour of Chimney: Brown

Total Chimney Height (m) = 1 (Number of stories in building) × 3 m (approx height of one story) + 2 (Height above roofline (m)) = 5 m

If swifts are present, are they: ☐ Nesting ☐ Roosting ☐ Unknown

Additional Comments:

None

Chimney material (please check one):

- [x] Brick
- [ ] Stucco
- [ ] Concrete
- [ ] Stone
- [ ] Other, please specify: ______

If possible, please draw a picture of the chimney location on the building, including the position where the coordinates were taken.

If the chimney is modified (cap, liner, etc.), please check the appropriate modification:

- [x] Cap
- [x] Terra Cotta Liner
- [ ] Animal Guard
- [ ] Spark Protector
- [ ] Metal Liner
- [ ] Other, please specify: ______

Surrounding habitat (please check one):

- [x] Residential / rural
- [ ] Industrial
- [ ] Commercial
- [ ] Natural
- [ ] Other, please specify: ______

Please select the **SHAPE** of your chimney and provide the appropriate estimated measurements:

- [ ] Round → Diameter (cm): ______
- [x] Square → Width (cm): ______
- [ ] Rectangular → Width (cm): 50 Length (cm): 50

NOTE: Measurements can sometimes be estimated by counting bricks. Standard bricks have the following measurements: **20cm x 9cm x 6cm (L x W x H)**

Chimney Assessment Form

Page 2

Chimney height above roofline (m): 3	Number of Flues: 2	Colour of Chimney: Brown

Total Chimney Height (m) = 1 (Number of stories in building) × 3 m (approx height of one story) + 3 (Height above roofline (m)) = 6m m

If swifts are present, are they: ☐ **Nesting** ☐ **Roosting** ☐ **Unknown**

Additional Comments:

None.
